DIGEST OF ENERGY AND WATER STATISTICS - 2006

FOREWORD

This is the ninth issue of a regular publication of the Central Statistics Office on energy and water statistics. It presents latest available statistics on energy and water. All data refer to the Republic of Mauritius, unless otherwise specified, and may be subject to revision in subsequent issues of the digest.

It is hoped that the statistics contained in this publication will prove useful to a wide range of users including planners, policy makers and research workers.

This digest has been prepared with the collaboration of the Ministry of Public Utilities, the Central Electricity Board, the Central Water Authority and several other public and private organisations. The co-operation and assistance of all these organisations are gratefully acknowledged.

H. Bundhoo

Glossary

Energy sector

Bagasse	A cellulosic residue left after sugar is extracted from sugar cane. It is mostly used as a fuel within the sugar milling factories.
Bunkers	Refer to the amount of fuels delivered to ocean-going ships or aircraft of all flags engaged in international traffic. Deliveries to ships engaged in transport in inland and coastal waters, or to aircraft engaged in domestic flights, are not included.
Calorific values	The energy content of a fuel is equivalent to the heat released on complete combustion of the fuel.
Capacity	<p>The maximum power available from a power station at a point in time:</p> <ul style="list-style-type: none"> - <i>Installed capacity</i>: The nameplate capacity of the generator set. - <i>Plant capacity</i>: The net capacity measured at the terminals of the stations, i.e., after deduction of the power absorbed by the auxiliary installations and the losses in the station transformers. - <i>Effective capacity</i>: It is the plant capacity less any amount of derated capacity from the install capacity.
Charcoal	Comprises the solid residue obtained by the destructive distillation of wood in the absence of air.
Coal	Fossil fuel that has a high degree of coalification, with a gross calorific value over 24MJ/kg (5700 Kcal/kg) on an ash-free but moist basis.
Conversion factors	Factors used to convert quantities from original physical units into a common accounting unit for the purpose of aggregating diverse energy sources. The ‘tonne of oil equivalent’ (toe) has been adopted as the accounting unit.
Diesel Oil	Consists primarily of medium oil distilling between 180°C and 380°C.
Energy	Means the capacity for doing work or for producing heat. Producing heat is a common manifestation of ‘doing work’ as are producing light and motive force.
Energy Balance	Shows in a consistent accounting framework, the production, transformation and final consumption of all forms of energy for a given geographical area and a given period of time, with quantities expressed in terms of a single accounting unit for purposes of comparison and aggregation. The energy balance thus presents an overview of the energy produced and consumed in a system, matching input and output for a specific time period, usually a year.

Energy unit	Express fuel and energy in energy content. The International System of Units (SI unit) of energy is the Joule. Historically the ‘tonne of coal equivalent’ was used, but with ascendance of oil, this has been largely replaced by the ‘tonne of oil equivalent’ (toe), defined as 41.868 gigajoules.
Final Energy Consumption	Energy consumption by final user- i.e. energy which is not being used for transformation into other forms of energy. The consumption by sector is presented as follows:
	<p>Agriculture: Energy used for irrigation and by other agricultural equipments;</p> <p>Commercial and distributive trade: Energy consumed by the business and commercial sector;</p> <p>Household: Consumption of energy by households;</p> <p>Manufacturing: Consumption in industry and construction; and</p> <p>Transport: Includes consumption by land vehicles, ships and local aircrafts.</p>
Fuels	The term fuel is used to describe those energy sources, whether primary or secondary, that must be subjected to combustion or fission in order to release the energy stored up inside them.
Fuel wood	The term ‘fuel wood’ embraces all forms of woody material.
Fuel Oils	The heavy oils from the refining process and used essentially as fuel in power stations.
Gasolene	Comprises a mixture of relatively volatile hydrocarbons with or without small quantities of additives, which have been blended to form a fuel suitable for use in spark-ignition internal combustion engines.
Gross Domestic Product (GDP)	It represents the aggregate money value of all goods and services produced within a country out of economic activity during a specified period, usually a year, before provision for the consumption of fixed capital.
Gigawatt hour (GWh)	Unit of electrical energy, equal to 0.0036 terajoules (TJ).
Hydro	Energy derived from the potential and kinetic energy content of water.
Imports	Refer to amount of fuels obtained from other countries.
Indigenous production	Comprises hydro electricity, fuel wood, bagasse and electricity from wind generation.
IPP (Independent Power Producers)	Undertakings which, in addition to their main activities, themselves produce (individually or in combination) electric energy intended, in whole or in part, to meet their own needs and for sale to the CEB.
Jet fuel Kerosene-type	Refers to medium oils meeting the required properties for use in jet engines and aircraft-turbine engines.

Kerosene (exlc. Jet fuel type)	A medium oil distilling between 150 ⁰ C and 300 ⁰ C and which is used in sectors other than aircraft transport.
Kilowatt hour (kWh)	It is a precise measure of heat and work. 1kWh=3.6 x 10 ⁶ joules
Liquefied petroleum Gas (LPG)	Gas usually propane or butane, derived from oil and put under pressure so that it is in liquid form. Often used to power cooking stoves or heaters and to fuel some types of vehicle.
Losses (Distribution loss)	Comprise losses in transmission and distribution of electric energy and losses in transformers, which are <i>not</i> considered as integral parts of the power stations.
Megawatt (MW)	A unit of electrical power, equal to 10 ⁶ watts, i.e 1000kW
Own use (Station use and loss)	Included are consumption by station auxiliaries and losses in transformers, which are considered as integral parts of the power stations.
Primary energy	Primary energy designates energy from sources that involve only extraction or capture, with or without separation from contiguous material, cleaning or grading, before the energy embodied in that source can be converted into heat or mechanical work. Primary energy is not derived from any other forms of energy. By convention, sources of energy that occur naturally such as coal, natural gas, fuelwood are termed primary energy.
Primary energy requirement	It is the sum of imported fuels and locally available fuels less re-exports to bunkers after adjusting for stock changes.
Production	Comprises gross production, i.e., the amount of electric energy produced, including that consumed by station auxiliaries and any losses in transformers that are considered integral parts of the power station.
Secondary energy	Secondary energy designates energy from all sources of energy that results from transformation of primary sources. e.g charcoal from fuelwood.
Statistical differences	This is the difference between calculated and observed inland consumption.
Solar	Energy derived from solar radiation directly by photovoltaic effect, or indirectly by thermal transformation.
Stock change/Statistical error	This is the difference between calculated and observed inland consumption.
Thermal plants	Comprises of conventional thermal plants of all types, whether or not equipped for the combined generation of heat and electric energy. They include steam-operated generating plants and plants using internal combustion engines or gas turbines.

Thermal sources of electricity	These include coal, oil and bagasse.
Transformation	Those fuels used directly in producing other fuels.
Watt (W)	The conventional unit to measure a rate of flow of energy. One watt amounts to 1 Joule per second.
Wind energy	Energy derived from the action of the wind.

Water

Water Balance	The water balance is based on long term records of annual average rainfall and indicates how freshwater resources are distributed.
Evapotranspiration	Combined loss of water by evaporation from the soil or surface.
Surface runoff	The flow of surface water, from rainfall, which flows directly to streams, rivers, lakes and the sea.
Groundwater recharge	Process by which water is added from outside to fresh water found beneath the earth surface.
1mm rainfall	1 litre of rainwater per square metre of surface area

Energy conversion factors

The following energy conversion factors have been used to express the energy content of the different fuels in terms of a common accounting unit, namely the ‘tonne of oil equivalent’ (toe*).

Energy source	Tonne	toe
Gasolene	1	1.08
Diesel Oil	1	1.01
Dual Purpose Kerosene (DPK)	1	1.04
Fuel oil	1	0.96
Liquefied Petroleum Gas (LPG)	1	1.08
Coal	1	0.62
Bagasse	1	0.16
Fuelwood	1	0.38
Charcoal	1	0.74

	GWh	toe
Hydro/Wind	1	86
Electricity	1	86

* 1 toe = 41.84 gigajoule (net calorific value)

* * * * *

ENERGY AND WATER STATISTICS, 2006 – An overview

Introduction

This issue of the ‘Digest of Energy and Water Statistics,2006’ covers the period 1997 to 2006 for energy statistics, and the years 2002 to 2006 for water statistics. The figures have been compiled in close collaboration with the Ministry of Public Utilities, the Central Electricity Board, the Central Water Authority, the petroleum companies, the Independent Power Producers and the Meteorological Services. All data refer to the Republic of Mauritius, unless otherwise specified.

The energy data have been compiled according to the recommendation of the United Nation Manual, Series F No. 29 on Energy Statistics.

2. Energy

2.1 The energy balance

The energy balance (Tables 1.1 &1.2) shows the supply and final uses of electricity and the different types of fuel. Total primary energy requirement is obtained as the sum of indigenous production (hydro, fuelwood and bagasse) and imports less re-exports and bunkering, after stock adjustments. Final energy consumption is the total amount of energy required by end users as a final product. End-users are categorised into five sectors, namely manufacturing, transport, commercial and distributive trade, households and agriculture.

In order to compare the energy content of the different fuels, a common accounting unit, namely, tonne of oil equivalent (toe) is used. The conversion factors are given on page 12.

2.2 Total primary energy requirement

The total primary energy requirement of the country increased by 6.3%, from 1,293 ktoe in 2005 to 1,375 ktoe in 2006 (Table 2.1). Of this, imported fuels (petroleum products and coal) accounted for 81.5% (1,120 ktoe) while locally available sources supplied the remaining 18.5% (255 ktoe).

In 2006, imported petroleum products which amounted to 820 ktoe comprised mainly, fuel oil (33.3%), diesel (28.0%), aviation fuel (17.9%) and gasoline (11.7%).

Imported coal reached 300 ktoe, which showed a 32.7% increase when compared to 226 ktoe in 2005. This high increase of coal in the primary energy requirements was partly due to the full operation in 2006 of the Centrale Thermique du Sud Ltd, an Independent Power Producer, which generates electricity only from coal, and started operating in July 2005.

The indigenous production (255 ktoe) was mainly derived from bagasse (94.3%), hydro electricity (2.6%) and fuelwood (3.1%).

The total primary energy requirement index, with 1990 as base year (1990 = 100), increased by 11.1 points or 6.3% from 177.0 in 2005 to 188.1 in 2006. Per capita primary energy requirement increased by 5.8% from 1.04 toe to 1.10 toe (Table 1.3).

Energy intensity defined as total primary energy requirement (toe) per Rs 100,000 of GDP (in 1990 rupees) provides a measure of the efficiency with which energy is being used in production. A higher ratio indicates a less efficient use of energy. As shown in Table 1.3, energy intensity, which stood at 1.62 in 2005, rose to 1.66 in 2006 showing a decrease in efficiency.

2.2.1 Local production

Total energy production from local sources decreased by 3.0% from 263 ktoe in 2005 to 255 ktoe in 2006. Production of hydroelectricity went down from 9.9 ktoe to 6.6 ktoe while production of bagasse decreased from 245 ktoe to 240 ktoe (Table 2.1).

2.2.2 Imports of energy sources

Data on imports of energy sources show that some 1,338 ktoe of petroleum products and coal were imported in 2006 compared to 1,312 ktoe in 2005, representing an increase of 2.0%. Petroleum products decreased from 1,076 ktoe to 1,034 ktoe (-3.9%) while coal increased from 235 ktoe to 304 ktoe (+29.4%) (Table 2.3). As a result of higher prices of petroleum products and coal, the import bill was 26% higher in 2006, Rs 18,822 million against Rs 14,989 million in 2005 (Table 2.5).

2.2.3 Re-exports and bunkering

Of the 1,338 ktoe of imported energy sources, about 285 ktoe (21.3%) were supplied to foreign vessels and aircraft. Re-exports consisted of 124 ktoe of diesel oil (43.5%), 104 ktoe of aviation fuel (36.5%) and 57 ktoe of fuel oil (20.0%) (Table 2.6).

2.3 Electricity

2.3.1 Electricity Generation

Some 2,350 GWh (202 ktoe) of electricity were generated in 2006 as compared to 2,272 GWh (195 ktoe) in 2005, representing an increase of 3.4%. The Independent Power Producers supplied 52.9% of the total electricity generated and The Central Electricity Board (CEB), 47.1%. Thermal energy represented 96.7% and hydro, the remaining 3.3%. The peak demand in 2006 for Island of Mauritius reached 367.3 MW while that for Island of Rodrigues stood at 5.7 MW (Tables 3.1 – 3.6).

2.3.1 Fuel input for electricity generation

The different types of fuel used for electricity generation are shown in Table 3.7. Fuel input increased by 10.8%, from 609 ktoe in 2005 to 675 ktoe in 2006. The major components of the fuel input were coal (42.5%), fuel oil (32.2%) and bagasse (24.6%).

2.3.2 *Electricity sales*

Electricity sold increased by 5.8% from 1,777 GWh in 2005 to 1,880 GWh in 2006. The average sales price of electricity increased by 10.8% from Rs 3.25 per kWh to Rs 3.60 per kWh during the same period (Table 4.7).

The consumption of electricity per capita per annum stood at 1,500 kWh in 2006 compared to 1,430 kWh in 2005 (Table 1.3).

2.4 Final energy consumption

Final energy consumption increased by 3.4% from 846 ktoe in 2005 to 875 ktoe in 2006. “Transport” and “Manufacturing” were the two largest energy-consuming sectors accounting for 48.6% and 31.0% of energy consumed respectively. They were followed by “Household” (12.5%), “Commercial and Distributive Trade” (7.0%) and Agriculture (0.5%). The details on the different types of fuel consumed by each sector and the respective amounts are given in Table 4.1 – 4.6.

2.4.1 *Manufacturing*

Energy used for manufacturing process went up by 8.8% from 249 ktoe in 2005 to 271 ktoe in 2006. The contribution of bagasse was 74 ktoe, electricity, 72 ktoe, fuel oil, 56 ktoe and diesel oil, 50 ktoe.

2.4.2 *Transport*

In 2006, some 425 ktoe of energy were used for transportation, representing a rise of 1.5% over last year. Consumption of gasoline decreased from 100 ktoe to 96 ktoe (-4.0%) while that of diesel oil increased from 168 ktoe to 175 ktoe (+4.2%). Consumption of aviation fuel was 147 ktoe in 2006 compared to 143 ktoe in 2005 while the use of LPG in the transport sector increased slightly, from 7.3 ktoe in 2005 to 7.4 ktoe in 2006.

2.4.3 *Household*

Energy consumed by households decreased by 5.2% from 115 ktoe in 2005 to 109 ktoe in 2006. The two main sources of energy for households were electricity and LPG, representing 48.5% and 41.6% respectively of total energy consumed by households. Consumption of electricity increased by 1.7% whilst, that of LPG went down by 2.6%.

2.4.4 *Commercial and Distributive Trade*

Total energy consumption by “Commercial and Distributive Trade” sector rose by 9.7%, from 55.7 ktoe in 2005 to 61.1 ktoe in 2006. This was mainly the effect of an increase of electricity from 47.9 ktoe to 50.0 ktoe (+4.4%) coupled with that of LPG which increased from 7.5 ktoe to 10.7 ktoe (+42.7%).

2.4.5 Agriculture

Energy consumption in ‘Agriculture’ increased slightly from 4.7 ktoe to 4.8 ktoe. Electricity and diesel were the only two sources of energy used in this sector. In 2006, about 2.5 ktoe of electricity were used for irrigation and 2.3 ktoe of diesel oil were used for derocking of land and for the preparation of soil prior to plantation.

3 Water

3.1 Water balance

The estimated water balance for the Island of Mauritius is shown in Table 6.1. The water balance indicates how fresh water resources are distributed. In 2006, the Island of Mauritius registered 3,571 million of cubic metres (Mm^3) of rainfall. Some $1,071 Mm^3$ of water was lost through evapotranspiration, while surface run-off and ground water recharge were $2,143 Mm^3$ and $357 Mm^3$ respectively.

3.2 Rainfall

Table 6.6 shows the amount of rainfall recorded around the island of Mauritius . During the year 2006, the mean amount of rainfall recorded around the island of Mauritius was 1,914 millimetres, a 19.3% decrease compared to 2,372 millimetres registered in 2005. The mean rainfall was highest during the month of March with 459 mm and the driest month, December, registered only 46 mm of rainfall.

In Rodrigues, the mean rainfall registered was 1,189 millimetres at Pointe Canon and 1,064 millimetres at Plaine Corail, Table 6.7.

3.3 Water storage level

In 2006, the minimum and maximum percentage water storage level of the different reservoirs were as follows:

Reservoir	Minimum (%)	Maximum (%)
Mare aux Vocoas	46	96
La Nicoliere	23	100
Piton du Milieu	54	100
La Ferme	15	100
Mare Longue	0	74
Midlands Dam	46	100

During the same period the mean water level for all reservoirs combined together (excluding Midlands Dam) varied from 45% to 95% (Table 6.8). It is to be noted that the mean water level is computed as the average level during a month, the normal is the longterm mean for 1990 to 1999.

3.4 Water production

In 2006 the total volume of potable water treated by the different treatment plants amounted to 187 million cubic metres (Mm^3), a 4.1% decrease compared to 195 Mm^3 in 2005. During the same year, average water production from surface and ground water represented 51.4% and 48.6% respectively (Table 6.9).

3.5 Water sales and revenue collectible

Total volume of water sold increased from 107.8 Mm^3 in 2005 to 108.5 Mm^3 in 2006 (+0.6%). In 2006, potable water made up 86.8% of the volume sold and the remaining 13.2% consisted of non-treated water. Water for domestic consumption amounted to 73.3 Mm^3 , accounting for nearly 67.5% of the total volume of water sold (Table 6.10).

The amount of revenue collectible for the year 2006 amounted to Rs 954.3 million, that is an increase of 2.1% over the amount of Rs 934.5 million for 2005 (Table 15).

Section I

Energy balance & Main indicators

Table 1.1 - Energy balance, 2006

Source Flow	Coal	Gasoline	Diesel	Aviation Fuel	Kerosene	Fuel Oil	LPG	Fuelwood	Charcoal	Hydro	Wind	Bagasse	Electricity	Tonne of oil equivalent (toe)
