DIGEST OF ENERGY AND WATER STATISTICS - 2008

FOREWORD

This is the eleventh issue of a regular publication of the Central Statistics Office on energy and water statistics. It presents latest statistics on energy for the years 1999 to 2008, and on water for the period 2004 to 2008. All data refer to the Republic of Mauritius, unless otherwise specified and may be subject to revision in subsequent issues of the digest.

It is hoped that the statistics contained in this publication will prove useful to a wide range of users including planners, policy makers and research workers.

This digest has been prepared with the collaboration of the Central Electricity Board, the Central Water Authority and several other public and private organisations. The co-operation and assistance of all these organisations are gratefully acknowledged.

This publication, together with other publications of the Central Statistics Office, is available on the website <http://statsmauritius.gov.mu>.

Glossary

Energy sector

Bagasse	A cellulosic residue left after sugar is extracted from sugar cane. It is mostly used as fuel within the sugar milling factories.
Bunkers	Refer to the amount of fuels delivered to ocean-going ships or aircraft of all flags engaged in international traffic. Deliveries to ships engaged in transport in inland and coastal waters, or to aircraft engaged in domestic flights, are not included.
Calorific values	The energy content of a fuel is equivalent to the heat released on complete combustion of the fuel.
Capacity	<p>The maximum power available from a power station at a point in time:</p> <ul style="list-style-type: none"> - <i>Installed capacity</i>: The nameplate capacity of the generator set. - <i>Plant capacity</i>: The net capacity measured at the terminals of the stations, i.e., after deduction of the power absorbed by the auxiliary installations and the losses in the station transformers. - <i>Effective capacity</i>: It is the plant capacity less any amount of derated capacity from the install capacity.
Charcoal	Comprises the solid residue obtained by the destructive distillation of wood in the absence of air.
Coal	Fossil fuel that has a high degree of coalification, with a gross calorific value over 24MJ/kg (5700 Kcal/kg) on an ash-free but moist basis.
Conversion factors	Factors used to convert quantities from original physical units into a common accounting unit for the purpose of aggregating diverse energy sources. The ‘tonne of oil equivalent’ (toe) has been adopted as the accounting unit.
Diesel Oil	Consists primarily of medium oil distilling between 180°C and 380°C.
Energy	Means the capacity for doing work or for producing heat. Producing heat is a common manifestation of ‘doing work’ as are producing light and motive force.
Energy Balance	Shows in a consistent accounting framework, the production, transformation and final consumption of all forms of energy for a given geographical area and a given period of time, with quantities expressed in terms of a single accounting unit for purposes of comparison and aggregation. The energy balance thus presents an overview of the energy produced and consumed in a system, matching input and output for a specific time period, usually a year
Energy intensity	Provides a measure of the efficiency with which energy is being used in production.
Energy unit	Express fuel and energy in energy content. The International System of Units (SI unit) of energy is the Joule. Historically the ‘tonne of coal equivalent’ was used, but with ascendance of oil, this has been largely replaced by the ‘tonne of oil equivalent’ (toe), defined as 41.868 gigajoules.
Final Energy Consumption	Energy consumption by final user- i.e. energy which is not being used for transformation into other forms of energy. The consumption by sector is presented as follows:

Agriculture: Energy used for irrigation and by other agricultural equipments;
Commercial & distributive trade: Energy consumed by the business and commercial sector;
Residential: Consumption of energy by residential sector;
Manufacturing: Consumption in industry and construction; and
Transport: Includes consumption by land vehicles, ships and local aircrafts.

Fossils fuels	Formed from the fossilized remains of dead plants and animals by exposure to heat and pressure in the Earth's crust over hundreds of millions of years.
Fuels	The term fuel is used to describe those energy sources, whether primary or secondary, that must be subjected to combustion or fission in order to release the energy stored up inside them.
Fuel wood	The term 'fuel wood' embraces all forms of woody material.
Fuel Oils	The heavy oils from the refining process and used as fuel in power stations. It is also commonly used by ships and industrial large-scale heating boilers installations as a fuel in furnaces or boilers.
Gasolene	Comprises a mixture of relatively volatile hydrocarbons with or without small quantities of additives, which have been blended to form a fuel suitable for use in spark-ignition internal combustion engines.
Gross Domestic Product (GDP)	It represents the aggregate money value of all goods and services produced within a country out of economic activity during a specified period, usually a year, before provision for the consumption of fixed capital.
Gigawatt hour (GWh)	Unit of electrical energy, equal to 0.0036 terajoules (TJ).
Hydro	Energy derived from the potential and kinetic energy content of water.
Imports	Refer to amount of fuels obtained from other countries.
Indigenous production	Comprises hydro electricity, fuel wood, bagasse and electricity from wind generation.
IPP (Independent Power Producers)	Undertakings which, in addition to their main activities, themselves produce (individually or in combination) electric energy intended, in whole or in part, to meet their own needs and for sale to the CEB.
Jet fuel Kerosene-type	Refers to medium oils meeting the required properties for use in jet engines and aircraft-turbine engines.
Kerosene (exlc. Jet fuel type)	A medium oil distilling between 150°C and 300°C and which is used in sectors other than aircraft transport.
Kilowatt hour (kWh)	It is a precise measure of heat and work. 1kWh=3.6 x 10 ⁶ joules
Liquefied petroleum Gas (LPG)	Consists mainly of propane or butane, derived from oil. It is normally liquefied under pressure for transportation and storage. It is often used to power cooking stoves or heaters and to fuel some types of vehicle.
Losses (transmission / distribution losses)	Comprise losses in transmission and distribution of electric energy and losses in transformers, which are <i>not</i> considered as integral parts of the power stations.

Megawatt (MW)	A unit of electrical power, equal to 10^6 watts, i.e 1000kW
Own use (Station use and loss)	Included are consumption by station auxiliaries and losses in transformers, which are considered as integral parts of the power stations.
Peak demand	Peak demand, peak load or on peak are terms used in energy demand management describing a period in which electrical power is expected to be provided for a sustained period at a significantly higher than the average supply level. Peak demand fluctuations may occur on daily, monthly seasonal and yearly cycles.
Petroleum products	The primary source of petroleum products is crude oil. Petroleum or crude oil is a naturally occurring, flammable liquid found in rock formations in the Earth. Diesel oil, fuel oils, Gasoline, Kerosene and Liquefied petroleum gas(LPG) are among the major products of oil refineries.
Primary energy	Primary energy designates energy from sources that involve only extraction or capture, with or without separation from contiguous material, cleaning or grading, before the energy embodied in that source can be converted into heat or mechanical work. Primary energy is not derived from any other forms of energy. By convention, sources of energy that occur naturally such as coal, natural gas, fuelwood are termed primary energy.
Primary energy requirement	It is the sum of imported fuels and locally available fuels less re-exports to bunkers after adjusting for stock changes.
Production	Comprises gross production, i.e., the amount of electric energy produced, including that consumed by station auxiliaries and any losses in transformers that are considered integral parts of the power station.
Renewables or Renewable sources of energy	Renewables are natural resources that, after exploitation, can return to their previous stock levels by natural processes of growth or replenishment. Conditionally renewable resources are those whose exploitation eventually reaches a level beyond which regeneration will become impossible. Such is the case with the clear-cutting of tropical forests.
Secondary energy	Secondary energy designates energy from all sources of energy that results from transformation of primary sources. e.g charcoal from fuelwood.
Statistical differences	This is the difference between calculated and observed inland consumption.
Solar	Energy derived from solar radiation directly by photovoltaic effect, or indirectly by thermal transformation.
Stock change / Statistical error	This is the difference between calculated and observed inland consumption.
Thermal plants	Comprises of conventional thermal plants of all types, whether or not equipped for the combined generation of heat and electric energy. They include steam-operated generating plants and plants using internal combustion engines or gas turbines.
Thermal sources of electricity	These include coal, oil and bagasse.

Transformation	Those fuels used directly in producing other fuels.
Watt (W)	The conventional unit to measure a rate of flow of energy. One watt amounts to 1 Joule per second.
Wind energy	Energy derived from the action of the wind.

Water Sector

Evapotranspiration	Combined loss of water by evaporation from the soil or surface.
Groundwater recharge	Process by which water is added from outside to fresh water found beneath the earth surface.
Surface runoff	The flow of surface water, from rainfall, which flows directly to streams, rivers, lakes and the sea.
Water Balance	The water balance is based on long term records of annual average rainfall and indicates how freshwater resources are distributed.
1mm rainfall	1 litre of rainwater per square metre of surface area.

* * * * *

Energy conversion factors

The following energy conversion factors have been used to express the energy content of the different fuels in terms of a common accounting unit, namely the ‘tonne of oil equivalent’ (toe*).

Energy source	Tonne	toe
Bagasse	1	0.16
Charcoal	1	0.74
Coal	1	0.62
Diesel Oil	1	1.01
Dual Purpose Kerosene (DPK)	1	1.04
Fuel oil	1	0.96
Fuelwood	1	0.38
Gasolene	1	1.08
Liquefied Petroleum Gas (LPG)	1	1.08

	GWh	toe
Electricity	1	86
Hydro/Wind	1	86

* 1 toe = 41.84 gigajoule (net calorific value)

ENERGY AND WATER STATISTICS, 2008 – An overview

Introduction

This issue of the ‘Digest of Energy and Water Statistics, 2008’ covers the period 1999 to 2008 for energy statistics, and the years 2004 to 2008 for water statistics. The figures have been compiled in close collaboration with the Central Electricity Board (CEB), the Central Water Authority (CWA), the Water Resources Unit, the Meteorological Services, petroleum companies and Independent Power Producers (IPPs). All data refer to the Republic of Mauritius, unless otherwise specified. Some of the figures, given in the text below, have been rounded off for easy interpretation.

The energy data have been compiled according to the recommendation of the United Nation Manual, Series F No. 29 on Energy Statistics.

2. Energy

2.1 The energy balance

The energy balance (Tables 1.1 &1.2) shows the supply and final uses of electricity and the different types of fuel in the national economy. Total primary energy requirement is obtained as the sum of indigenous production (hydro, fuelwood and bagasse) and imports less re-exports and bunkering, after stock adjustments. Final energy consumption is the total amount of energy required by end users as a final product. End-users are categorized into six sectors, namely manufacturing, transport, commercial and distributive trade, residential, agriculture and other.

In order to compare the energy content of the different fuels, a common accounting unit, namely, tonne of oil equivalent (toe) is used. The conversion factors are given on page 12.

2.2 Primary energy requirement

The total primary energy requirement of the country increased by 1.6%, from 1,382 ktoe in 2007 to 1,404 ktoe in 2008 (Table 2.1). Of this, imported fuels (petroleum products and coal) accounted for 81.2% (1,141 ktoe) while locally available sources supplied the remaining 18.8% (264 ktoe).

Imported petroleum products in 2008 decreased from 781 ktoe in 2007 to 737 ktoe. The petroleum products comprised mainly fuel oil (28.9%), diesel (27.8%), aviation fuel (18.6%) and gasoline (14.9%).

In 2008, coal reached 404 ktoe, which showed a 13.8% increase over the 355 ktoe of 2007. This increase of coal in the primary energy requirements was partly due to the coming into full operation of the ‘Compagnie Thermique de Savannah Limitée’ (CTSav), an Independent Power Producer which has a coal and bagasse co-generation plant.

The local production (264 ktoe) comprised renewables including bagasse (93.5%), hydro/wind electricity (3.5%) and fuelwood (2.9%).

The total primary energy requirement index, with 1990 as base year (1990 = 100), moved from 189.1 in 2007 to 192.1 in 2008 and the per capita primary energy requirement increased by 1%, up from 1.10 toe in 2007 to 1.11 toe in 2008.

Energy intensity defined as total primary energy requirement (toe) per Rs 100,000 of GDP (in 1990 rupees) provides a measure of the efficiency with which energy is being used in production. As shown in Table 1.3, energy intensity, which was 1.58 in 2007 dropped to 1.54 in 2008. A lower ratio usually reflects a more efficient use of energy.

2.2.1 Local production

Total energy production from local renewable sources increased by 7.3% from 246 ktoe in 2007 to 264 ktoe in 2008. This was primarily due to a higher production of bagasse. Thus generation from bagasse increased from 230 ktoe to 246 ktoe. Moreover, production of hydro/wind electricity increased from 7.2 ktoe in 2007 to 9.3 ktoe in 2008. (Table 2.1)

2.2.2 Imports of energy sources

Data on imports of energy sources show that some 1,451 ktoe of petroleum products and coal were imported in 2008 compared to 1,482 ktoe in 2007, representing a decrease of 2.1%. Petroleum products went down from 1,080 ktoe to 1,075 ktoe (-0.5%) and coal decreased from 402 ktoe to 376 ktoe (-6.5%) (Table 2.3).

Due to the increases in the prices of petroleum products and coal, the import bill went up by 27.7% to reach Rs 27,635 millions in 2008 from Rs 21,640 millions in preceding year. (Table 2.5).

2.2.3 Re-exports and bunkering

Of the 1,451 ktoe of imported energy sources in 2008, about 341 ktoe (23.5%) were supplied to marine vessels and aircraft. Re-exports consisted of 131 ktoe of aviation fuel (38.2%), 119 ktoe of diesel oil (34.7%), and 92 ktoe of fuel oil (27.1%). The following changes were noted compared to the previous year: Fuel Oil (+27.1%), Aviation fuel (+7.5%), Diesel (-0.9%), overall (+8.8%) (Table 2.6).

2.3 Electricity

2.3.1 Electricity Generation

Some 2,557 GWh (220 ktoe) of electricity was generated in 2008 as compared with 2,465 GWh (212 ktoe) in 2007, representing an increase of 3.7%. The Independent Power Producers (IPPs) supplied 63.2 % of the electricity generated and the Central Electricity Board (CEB), only 36.8%. Thermal energy represented 95.8% and hydro/wind the remaining 4.2%. The peak demand in 2008 was 378.1 MW (+2.7%) in the Island of Mauritius as compared with 368 MW in 2007. (Tables 3.1 - 3.6)

2.3.2 Fuel input for electricity generation

The different types of fuel used for electricity generation are shown in Table 3.7. The mix of fuels used to generate electricity continues to evolve. Fuel input increased by 6.2% from 707 ktoe in 2007 to 751 ktoe in 2008. The major components of the fuel input were coal, (50.4%), bagasse (27.7%) and fuel oil (21.4%).

2.33 Electricity sales

In 2008, electricity sales increased by 4% from 1,975 GWh in 2007 to 2,054 GWh. The average sales price of electricity went up by 26.9 % from Rs 3.79 per kWh to Rs 4.81 per kWh during the same period (Table 4.7).

The per capita consumption of electricity sold per annum stood at 1,619 kWh in 2008 compared with 1,567 kWh in 2007 (Table 1.3).

2.4 Final energy consumption

Final energy consumption fell by 1.9% from 858 ktoe in 2007 to 842 ktoe in 2008. “Transport” and “Manufacturing” were the two largest energy-consuming sectors accounting for 48.3% and 29.4% of energy consumed respectively. They were followed by “Residential” (13.1%), “Commercial and Distributive Trade” (8.2%) and “Agriculture” (0.5%). The details on the different types of fuel consumed by each sector and the respective amounts are given in Tables 4.1 to 4.6.

2.4.1 Manufacturing

Energy used for manufacturing processes decreased by 6.1% from 264 ktoe in 2007 to 248 ktoe in 2008. The contribution of electricity was 78 ktoe, fuel oil, 52 ktoe, diesel oil, 47 ktoe, and bagasse, 38 ktoe.

2.4.2 Transport

In 2008, some 406 ktoe of energy were used for transportation, representing a decrease of 1.2% over last year’s figure of 411 ktoe. Consumption of gasoline increased from 107 ktoe to 109 ktoe (+1.9%) and that of diesel oil from 153 ktoe to 154 ktoe (+0.7%). Consumption of aviation fuel decreased from 144 ktoe in 2007 compared to 137 ktoe in 2008 (-4.9%) and the use of LPG in the transport sector also decreased from 7.2 ktoe in 2007 to 5.6 ktoe in 2008 (-22.0%).

2.4.3 Commercial and Distributive Trade

Total energy consumption by “Commercial and Distributive Trade” sector rose by 6.0% from 65 ktoe in 2007 to 69 ktoe in 2008. In this sector, electricity consumption increased from 53 ktoe to 58 ktoe (+9.4%) while LPG decreased from 11.8 ktoe to 10.9 ktoe (-7.6%).

2.4.4 Residential

Energy consumed by the ‘Residential’ sector in 2008 (excluding fuel used for transport) increased slightly from 109 ktoe in 2007 to 110 ktoe in 2008. The two main sources of energy were electricity and LPG, representing 50.9% and 41.5% respectively of total energy consumed by households. Consumption of electricity increased by 1.4% and that of LPG by 0.7%.

2.4.5 Agriculture

Energy consumption in Agriculture went down from 4.9 ktoe in 2007 to 4.5 ktoe in 2008 (-8.2%). Electricity and diesel were the only two sources of energy used in this sector. In 2008, about 2.2 ktoe of electricity were used mainly for irrigation and 2.3 ktoe of diesel oil were used mainly for mechanical operations in field.

3 Water

3.1 Water balance

The estimated water balance for the Island of Mauritius is shown in Table 6.1. The water balance indicates how fresh water resources are distributed. In 2008, the Island of Mauritius registered 4,440 million of cubic metres (Mm^3) of rainfall. Some 1,332 Mm^3 of water was lost through evapotranspiration, while surface run-off and ground water recharge were 2,664 Mm^3 and 444 Mm^3 respectively.

3.2 Rainfall

Table 6.6 shows the amount of rainfall recorded around the Island of Mauritius. During the year 2008, the mean amount of rainfall recorded around was 2,382 millimetres, a 21.9 % increase compared with 1,954 millimetres registered in 2007. March was the wettest month of 2008, registering a mean rainfall of 508 mm whereas April was the driest month with a mean rainfall of 53 mm.

For the Island of Rodrigues, the mean rainfall registered in 2008 was 1,055 millimetres compared with 945 in 2007. May recorded the highest amount of rainfall with 157 mm and April the least with 21 mm. (Table 6.7)

3.3 Water storage level

In 2008, the minimum and maximum percentage water storage level of the different reservoirs was as follows:

Reservoir	Minimum (%)	Maximum (%)
Mare aux Vacoas	34 (Jan)	93 (Sep-Oct)
La Nicolieire	40 (Jan)	100 (Feb-Apr) (Jun-Oct)
Piton du Milieu	44 (Jan)	100 (Feb-Sep)
La Ferme	21 (Jan)	100 (May-Oct)
Mare Longue	41 (Jan)	100 (Mar-Oct)
Midlands Dam	33(Jan)	100 (Mar-Nov)

The mean water level, in 2008 for all reservoirs combined together (excluding Midlands Dam) varied from 37% to 94% (Table 6.8). It is to be noted that the mean water level is computed as the average level during a month while the normal is the long term mean averaged over the period 1990 to 1999.

3.4 Water production

In 2008 the total volume of portable water treated by the different treatment plants amounted to 209 million cubic (Mm^3), up by 1.5% compared with 206 Mm^3 in 2007. During the same year, average water production from surface and ground water represented 49% and 51% respectively (Table 6.9).

3.5 Water sales and revenue collectible

Total volume of water sold increased from 110.7 Mm^3 in 2007 to 108.8 Mm^3 in 2008 (-1.7%). In 2008, potable water made up 86.4% of the volume sold and the remaining 13.6% consisted of non-treated water. Water for domestic consumption amounted to 72 Mm^3 , accounting for nearly 66.2% of the total volume of water sold (Table 6.10).

The amount of revenue collectible for the year 2008 amounted to Rs 951.7 million, that is a decrease of 5.4% over the amount of Rs 1,005.5 million for 2007 (Table 15).
