National Accounts of Mauritius - 1992

Foreword

This is the tenth issue of a series of annual reports on the National Accounts of Mauritius published by the Central Statistical Office.

This publication is intended to present the latest available data describing the performance of the economy over the last four years (1989 - 1992). Data for 1991 and 1992 are provisional and subject to revision in later issues.

The first part of the report describes concepts, methodology and sources of information used in the compilation of the national accounts estimates, and the second part contains detailed economic accounts. An Input-Output table for the year 1987 is also given in section V.

The Central Statistical Office makes considerable effort to provide objective, reliable and timely information for the benefit of users. It is hoped that the data herewith published will prove valuable to decision makers, planners and researchers. Further any constructive criticism or suggestion for improvement of this report will be most welcome.

The preparation of this report has required the mobilisation of considerable resources and cooperation on the part of numerous organisations. This valuable assistance from both public and private organisations is herewith gratefully acknowledged.

(D. Zmanay)

INTRODUCTION	1
<u>CONCEPTS AND DEFINITIONS</u>	
1. Classification by kind of economic activity	7
2. Definition of main aggregates	8
<u>PART I - METHODOLOGY</u>	
1. Production account of each economic activity	11
1.1 - Agriculture, hunting, forestry and fishing	11
1.2 - Sugar industry	13
1.3 - Mining and quarrying	15
1.4 - Manufacturing	15
1.5 - Electricity, gas and water	16
1.6 - Construction	16
1.7 - Wholesale and retail trade, restaurants and hotels	17
1.8 - Transport, storage and communication	19
1.9 - Financing, insurance, real estate and business services	20
1.10 - Producers of government services	21
1.11 - Community, social and personal services	23
2. Cost components of the Gross Domestic Product	24
3. Gross Domestic Fixed Capital Formation	24
4. Estimates at constant prices	26
5. Institutional sector accounts	29
<u>PART II - STATISTICAL TABLES</u>	
<u>SECTION I - NATIONAL ACCOUNTS - MAIN TABLES</u>	
Table 1.1 - Main National Accounts aggregates, 1989 - 1992	31
1.2 - Growth rates and ratios, 1989 - 1992	33
1.3 - Gross domestic product by industry group at current factor cost, 1989 - 1992	34

CONTENTS (Cont'd)

INTRODUCTION

1. General

National accounting provides a comprehensive and detailed framework for the systematic and integrated recording of all the transaction flows relating to production, consumption and accumulation within the domestic territory and the rest of the world. The framework is presented in the three main accounts, namely the Production Account, the Income and Outlay Account and the Capital Finance Account.

It therefore contains a wealth of information indispensable for economic analysis and for the formulation and assessment of economic policies.

2. Historical background

National accounts data have been compiled by the Central Statistical Office (C.S.O.) since 1952. Data, up to 1975, have been compiled according to the recommendations of the 1952 System of National Accounts (Old SNA). From 1976 onwards, the C.S.O. has adopted the 1968 New SNA which is a revision and an extension of the former one. National Accounts statistics are now compiled according to the recommendations of the United Nations Manual, 'A System of National Accounts, Studies in Methods, Series F, No. 2 Rev. 3'.

3. Data collection, compilation and publication

The data required for the compilation of National Accounts statistics are collected mainly through an annual census of industrial production and through various surveys. In addition, many organisations, both public and private are regularly contacted to obtain the latest available information on the key sectors of the economy. Data are collected under the authority of the Statistics Act, 1951 which lays great emphasis on the confidentiality aspect.

All the tables are compiled and presented, as far as possible, according to the recommendations of the United Nations System of National Accounts (SNA). A brief description of the methodology used for the preparation of the Accounts is given in Part I of this report.

National Accounts data are produced and published twice yearly viz in March and in September. The status of the figures at each issue is as follows:

March issue (year 1992)

Year	Status
1990	Revised estimates
1991	Preliminary estimates
1992	First forecast

The results are disseminated in two ways. As soon as they become available they appear in a special issue of the "Economic Indicators" published by the Ministry of Economic Planning and Development; later on they are included in the Annual Digest of Statistics published by the Central Statistical Office.

September issue (year 1992 as example)

Year	Status
1990	Final results
1991	Provisional estimates
1992	Revised forecast

The September figures are also disseminated in two ways. As soon as they become available, the summary results appear in a special issue of the "Economic Indicators". The present report is the second source of publication and contains the detailed results of the September version.

4. The report

This report contains the latest available National Accounts data relating to the years 1989 to 1992. Explanatory notes on the concepts, definitions and various methods used for the computation of the estimates are given in the first part of the report, whereas the statistical tables grouped as shown below, are contained in the second part.

Part I - Methodology

Part II - Statistical Tables

Section I - National accounts - main tables

Section II - Institutional sector accounts

Section III - Trade statistics

Section IV - Production data and selected indicators

Section V - Input - Output table

5. Problems and limitations of published data

The Central Statistical Office continues to face the same problems as mentioned in the previous reports viz.

(i) Response rate to the annual enquiries

The response rate to the annual enquiries undertaken by the office continues to improve. However, it appears that the fear that the C.S.O. discloses information to other authorities still persists among the suppliers of data. Data are collected under the authority of the Statistics Act, 1951, which guarantees the absolute confidentiality of all information. No information relating to individual units can therefore be revealed to any authority.

(ii) Non-uniformity of accounting years

Firms do not have uniform accounting years so that data collected referring to the last twelve-months period may spread over two or three consecutive years. Only in some cases, have data been adjusted before incorporation in the National Accounts. The time reference in accounts is the calendar year.

The varying accounting years are also major obstacles to the preparation of the Capital Finance and Balance Sheet Accounts.

6. Summary of results

6.1 *Output, 1991*

6.1.1 Overall & sectoral growths

Gross Domestic Product (G.D.P.) at current factor cost for the year 1991 amounted to Rs 35,956 million and net indirect taxes, Rs 6,806 million, so that G.D.P. at market prices totalled Rs 42,750 million.

The Gross National Product (G.N.P.) per capita at current market prices progressed by 12.5% from Rs 36,748 in 1990 to Rs 41,359 in 1991.

G.D.P. in real terms i.e. after elimination of price effects, grew by 4.7% compared to 7.2 % the previous year.

The main factors which contributed to the relatively low growth in 1991 are:

- (a) fall in sugar output resulting in a negative growth of 3% attributable to severe drought conditions
- (b) a low increase of only 1.1% registered in tourist sector as a direct consequence of the Gulf War.
- (c) a slow down in the construction sector to 2% following high growths at over 12% on average, between 1988 and 1990

The "Financial and Business Services" sector and the "Other Services" sector maintained the same tempo, each recording increases of around 8%.

6.1.2 Cost component of G.D.P.

Compensation of employees which comprises mainly wages and salaries paid in cash and kind, increased by Rs2,985 million or 14% to reach Rs16,975 million. Its share in G.D.P. at factor cost consequently rose from 46.8% in 1990 to 47.2% in 1991.

Disbursements by General Government as wages and salaries totalled Rs 4,016 million accounting for nearly 24% of the total wage bill.

Gross operating surplus (inclusive of consumption of fixed capital) attained Rs 42,975 million and represented 5.8% of G.D.P. at factor cost.

6.1.3 Consumption and Saving

Aggregate consumption expenditure, i.e. expenditure by private households and general government rose by Rs 3,134 million or 10.7% to Rs 22,430 million. After removing the effects of price increases of about 7%, the increase in real terms works out to 3.5%. This lower growth rate compares favourably with those of 19.9 and 19.0 in 1990 when they were 6.6% and 5.2% respectively and had a direct bearing on the level of domestic saving.

Gross domestic saving which is the difference between G.D.P. at market prices and aggregate consumption expenditure consequently progressed by 18.7% to Rs 10,520 million from Rs 8,694 million in 1990.

The saving rate (ratio of saving to G.D.P.), an important indicator of the health of the economy, rose to 24.1% after declining to 22.9% in 1990 from 23.3% in 1990.

6.1.4 Investment

Investment as measured by the Gross Domestic Fixed Capital Formation (G.D.F.C.F.) which represents expenditure on fixed assets during a period of 12 months, was valued at Rs 12,185 million. Investment level in the country (ratio of G.D.F.C.F. to G.D.P. at market prices) stood at 29% against 31.2% in 1990. It is recalled that the latter figure includes purchase of aircraft and marine vessel.

Compared with 1990 figures inclusive of the high investment, a 3% drop in the real growth level is noted; but exclusive of the aircraft and marine vessel, G.D.F.C.F. in 1991 pursued an increasing trend, growing by 7.3%.

Slightly over half of the total or Rs 6,575 million was spent on construction works. Investment in the construction of residential buildings mainly by private households maintained the same high growth of around 20% as recorded in the past four years.

The purchase of transport equipment and machinery amounted to Rs 5,810 million, representing a nominal rise of 1% over the previous year's figure of Rs 5,405 million (exclusive of aircraft and marine vessel).

Sectors which had incurred high growth in capital expenditure were: "Electricity, Gas and Water" where investment almost tripled to Rs 1,305 million, followed by "Agriculture", Rs 480 million and "Other Services", Rs 320 million. Investment by manufacturing enterprises remained at the previous year's level, with the E.P.Z Sector accounting for Rs 630 million, almost the same amount as in 1990.

The share of the public sector stood at Rs 3,515 million representing 28.4% of the total, while investment by private enterprizes and households attained Rs 8,870 million.

6.2 Output 1992 (forecast)

6.2.1 Overall and sectoral growths

It is now almost certain that the level of economic activity this year will be relatively higher than last year. Following recovery in the two main sectors namely sugar and tourism, the economy in 1992 is forecast to grow by 6.4% compared to 4.7% in 1991 and 7.2% in 1990.

G.D.P. at factor cost is expected to total Rs 39,700 million. 'Indirect taxes net of subsidies' has been revised downward to Rs 7,300 million. G.D.P. at market prices will therefore attain Rs 47,000 million.

The above overall growth rate has been arrived at on the basis of the following assumptions on sectoral output:

<u>Sector</u>	<u>1991</u>	<u>1992</u>	<u>Assumptions</u>
(a) Sugar	+3%	+7%	Sugar crop of 260,000 tonnes
(b) E.P.Z.	+6%	+6%	E.P.Z. exports of Rs 13,500 million
(c) Tourism	+2%	+8%	Tourist arrivals reaching 330,000, tourist earnings, Rs 4,400 million
(d) Construction	+8%	+10%	

(e) Finance, Insurance and Business Services (excluding ownership of dwellings)	+8.5%	+8.5%
Overall real growth	+4.7%	+6.4%

6.2.2 Investment

Information now available on investment intention suggest that the G.D.F.C.F. will grow by 6.9% in 1992 compared to 7.3% in 1991 (exclusive of aircraft and marine vessel).

Investment level however, will continue its upward trend and reach 30.1% from 29% a year ago.

Nearly one third of the total investment will be incurred by the Public sector where investment will amount to Rs 4,525 million against Rs 3,515 million in the previous year.

6.2.3 Consumption and Saving

Aggregate final consumption expenditure is forecast to grow in real terms, by about 3.5%, the same rate as in 1991 and reach Rs 35,375 million at current market prices.

Gross domestic saving will therefore reach Rs 11,625 million, improving the saving rate to 24.7% from 24.4% in 1991.

CONCEPTS AND DEFINITIONS

1. CLASSIFICATION BY KIND OF ECONOMIC ACTIVITY

The production account is divided into three categories:-

- (a) Industries
- (b) Producers of government services
- (c) Producers of private non-profit services to households.

(a) Industries comprise all establishments, public and private which produce commodities i.e. goods and services sold in the market at a price normally intended to cover their cost of production. 'Government industries' and 'departmental enterprises' are also included

'Government industries' encompass all government departments which are mainly engaged in selling the kinds of goods and services which are normally produced by private establishments. Departments classified here are:-

(i) Post and Telegraphs

(ii) Civil Aviation.

'Departmental enterprises' comprise government departments which furnish goods and services to the government itself or to a kind which are often provided by private establishments. Examples are the Printing Department and the repair and construction activity of the Ministry of Works.

(b) Producers of government services comprise all departments and other bodies of central and local governments which engage in such activities as administration, defence, health, educational and social services and promotion of economic growth. Social security schemes in respect of large sections of the community and non-profit institutions, entirely or mainly financed or controlled by government, are also included. Examples are the National Pension Scheme, the University of Mauritius and the Mauritius College of the Air.

(c) Producers of private non-profit services to households comprise bodies which mainly furnish social and community services to households free of charge, or at sale prices not intended to cover fully the cost of producing the services. These bodies are not entirely financed and controlled by the public authorities. Examples are the Mauritius Red Cross Society and the Mauritius Society for the Prevention of Cruelty to Animals. Domestic services rendered by one household to another, for example the services of maids, gardeners, etc. are also included in this section.

The economic activities within each of the categories (b) and (c) are further classified into activity groups on the lines of the International Standard Industrial Classification of all economic activities (ISIC)

2. DEFINITION OF MAIN AGGREGATES

The concepts and definitions used in this publication are those stated in the United Nations System of National Accounts (SNA) Manual - A System of National Accounts (Series F, No. 2, Rev. 3 1968).

Gross output

Gross output of industries covers the value in the market of goods and services produced, including work in progress and products for own use. Valuation is usually at producers' prices, that is the value at which the commodity leaves the producer before transport and distribution charges are added on. It also includes rents received on buildings, machinery and equipment, and the imputed rent of owner-occupied dwellings, but excludes rent on land.

Gross output of producers of government services and private non-profit services in households is equivalent to the sum of the cost of intermediate consumption, expenditure on compensation of employees, consumption of fixed capital and indirect taxes.

Intermediate consumption

Intermediate consumption of industries covers non-durable goods and services used up in production, including repairs and maintenance of the capital stock, research and indirect outlays on financing of capital formation such as transfer costs involved in purchases of land and intangible assets.

Intermediate consumption of producers of government services is made up of acquisitions (purchases and transfers in kind) of new goods and services in current account including durable goods acquired primarily for military purposes.

Value added (Net output)

The value added is equal to the gross output at producers' prices less the value of intermediate consumption at purchasers' prices. The sum of value added of all domestic producers gives the Gross Domestic Product (GDP).

Gross Domestic Product (G.D.P.)

G.D.P. is an aggregate measure of the total value of output (value added) produced by residents within the country in a specified period, usually a year, before provision for the consumption of fixed capital.

G.D.P. at factor cost

G.D.P. at factor cost is that part of the cost of producing the gross domestic product which consists of gross payments to factors of production (labour, land and capital).

G.D.P. at market prices

G.D.P. at market prices is equal to the G.D.P. at factor cost plus indirect taxes net of subsidies.

Gross National Product (G.N.P.)

G.D.P. plus net factor income from abroad which consists mainly of interest payments on foreign loans, gives Gross National Product (G.N.P.)

Gross domestic fixed capital formation (G.D.F.C.F.) consists of the net additions to the assets of producers of tangible reproducible goods which have an expected lifetime of use of more than one year. These assets are buildings, plants, machinery and transport equipment. The additions are valued at purchasers' value. Non-reproducible tangible assets such as land and mineral deposits are not included in gross capital formation. However, outlays on improvement of land and development of mining sites are considered as gross domestic fixed capital formation.

Durable goods purchased by households, with the exception of dwellings are not classified as capital formation but are treated as current outlays on consumption.

Increase in stocks

Increase in stocks includes the value of the physical change in stocks of raw materials, work in progress, and finished goods held by private producers.

Private final consumption expenditure

Private final consumption expenditure consists of the net expenditure on goods and services by households and expenditure of current nature by private non-profit institutions serving households. This item excludes purchases of dwellings by households but includes the imputed rent of owner-occupied dwellings.

Government final consumption expenditure

Government final consumption expenditure is defined as the sum of intermediate consumption, compensation of employees, consumption of fixed capital and payments of indirect taxes less the value of own account production of fixed assets and sales of goods and services.

Imports and exports of goods and services

Imports of goods and services include broadly the equivalent of general imports of merchandise as defined in external trade statistics plus imports of services and direct purchases abroad on current account, made by resident households and by government. Transfers of migrants' personal effects and gifts between households are also included. Exports of goods and services are defined to be parallel to the definition of imports given above. Exports are however, valued f.o.b. whereas imports are valued c.i.f.

Compensation of employees

Compensation of employees comprises all payments of wages and salaries by producers to their employees. Payment in kind and contributions to social security and to private pension fund, casualty insurance and similar schemes are also included.

Wages and salaries in cash comprise all payments which employees receive in respect of their work before deductions of employee contributions to social security schemes. Other payments e.g. refund of travelling to work, commissions, overtime, bonuses, and cost of living allowances are also included.

Payments in kind include goods and services provided to employees free of charge or at a markedly reduced cost which are clearly of direct benefit to the employees as consumers.

Operating surplus

Operating surplus is defined as the excess of value added over the cost of employees' compensation, consumption of fixed capital and indirect taxes reduced by subsidies.

Operating surplus can be earned by industries only. The gross output of producers of government and private non-profit services to households is defined as equivalent to their own production.

Indirect taxes less subsidies

Indirect taxes are taxes assessed to producers, i.e. enterprises and government, in respect of production, sale, purchase or use of goods and services, which are charged to the expenses of production. Examples are the export tax, on export, import and excise duties, taxes on gambling, licenses, etc.

Subsidies are grants made on current account by the government to enterprises in order to compensate for losses resulting from public policies. They are shown in the production account and treated as a negative indirect tax. For example, subsidy on fertilizers is included here as it is granted to producers, while subsidy on water and fertilizer is not included. Subsidy on rice and flour previously treated as a transfer to households is not included in the operating surplus of enterprises.

METHODOLOGY

1. Production Account of each Economic Activity Group

1.1 Agriculture, hunting, forestry and fishing

The agricultural sector accounted for about 11% of Gross Domestic Product in 1991. The activities in this sector are presented in the following sub-groups:-

- Industrial crops
- Foodcrops, fruits and flowers
- Livestock, poultry and related products
- Agricultural services
- Forestry and hunting
- Fishing

Methodology

Separate production accounts are prepared for each of the sub-groups mentioned above. The methodology adopted varies with the sources of information. Apart from sugar and tea, agricultural activities are performed mainly by small planters, breeders and fishermen who do not keep proper records of their transactions. Because of the lack of proper accounts a variety of methods, based essentially on the commodity approach, is used to estimate gross output, intermediate consumption and value added.

Growing of Industrial Crops

Sugar cane: Details on the sugar industry are given separately in Section 1.2.

Tea and Tobacco: The Tea Board and Tobacco Board provide data on total quantity produced and on prices paid to planters. Intermediate inputs per hectare are computed based on information obtained from the tea estates and a few tobacco planters. Total intermediate consumption is then obtained by applying the appropriate rates of inputs to the total area under cultivation.

Growing of foodcrops, fruits and flowers: In collaboration with the Ministry of Agriculture, data on foodcrops production and on acreage harvested are collected on a monthly basis. Estimates of backyard production are made, based on benchmark data obtained from Household Expenditure Surveys. The wholesale and retail prices of about forty foodcrops and fruits are collected weekly by this office. This enables the valuation of the products at market prices. Transport costs and marketing charges are estimated and deducted from the estimates at market prices to yield gross output at producers' prices.

Adhoc production cost surveys are carried jointly with the Extension Services of the Ministry of Agriculture which provide the necessary information on inputs. Intermediate consumption expenditure are then estimated by applying appropriate rates of inputs to the total acreage under cultivation. Some of the inputs, for example fertilizers, pesticides, seeds are cross-checked with imports and local production figures.

Fruits and flowers: Production of the two main fruits, banana and pineapple, is estimated along the same lines as described for foodcrops. As regards other fruits, the number of fruit trees in bearing is estimated based on the fruit trees survey undertaken by Extension Services of the Ministry of Agriculture. Production is first estimated in quantity using an average yield per tree. This production is valued at producers' prices.

Estimates are also made for flower production. The main source is exports statistics.

Livestock, poultry and related products: The Mauritius Meat Authority forwards a weekly return on abattoir statistics from which the number and carcass weight of local cattle, sheep, goats and pigs slaughtered are obtained. To these, are added the weight of off-abattoir slaughters estimated from permits issued by the Ministry of Agriculture. The total quantity multiplied by a weighted retail price gives the gross output at market prices. Estimates of intermediate expenditure on cattle feed, salt and water etc. are made and deducted from the gross output to obtain value added.

Poultry and egg production are calculated from data obtained through questionnaires sent to large producers. These data are supplemented with estimates made for small breeders. Valuation of the production and estimation of intermediate inputs are made according to the methods described above.

Milk production is worked out, based on benchmark data obtained from livestock censuses.

Agricultural Services: The Irrigation Authority, the Sugar Insurance Fund Board and the Sugar Planters' Mechanical Pool are some of the bodies which provide services to planters. Their respective production accounts are worked out from statistics obtained either from published reports or from direct enquiries.

Forestry and hunting: Forestry production is composed mainly of firewood used by households and sugar estates and wood processed by small mills for construction works. Estimates are made based on consumption data.

Hunting, mainly deer hunting, is undertaken during a specific period of the year. The associations of hunters provide estimates of the number of deer shot. Production of venison is estimated in quantity using an average weight per animal computed from past data. This is valued at producer's prices as for other livestock.

Intermediate cost for forestry and hunting are negligible so that the gross output is composed essentially of value added.

Fishing: The Fisheries Division of the Ministry of Agriculture provides data on the quantity of fish caught. Separate figures are given in respect of lagoon and bank fishing. These are then valued at market prices as the retail prices are readily available from the Consumer Price Index Unit of this office. The transport and retail margins are estimated and deducted from

the market price value to give gross output at producers' prices. Intermediate inputs for lagoon fishing is very low as the fishermen (around 2,700 in number) who are engaged in fishing in coastal waters, use artisanal methods and the catch is usually sold fresh. Bank fishing involves higher cost as the fish are caught in high seas in larger vessels. Also, these fish are sold frozen. Establishments engaged in bank fishing are interviewed by mail questionnaire and a production account is worked out from information received.

1.2 The Sugar Industry

The share of the sugar industry in total G.D.P. is around 10% and export of sugar represents around 29% of total domestic exports.

Cultivation of sugar cane accounts for about 92% of all lands under cultivation. There are three categories of farmers in the sugar industry namely millers, metayers and other planters.

The millers are owners of sugar factories and of large plots of land around these factories. In 1991, they numbered 19 and cultivated sugar cane on an area of 43,425 hectares of land. Metayers are normally employees of the millers who are allowed to grow sugar cane on some of the estates' land. The third class comprises planters who cultivate sugar cane on their own lands. There are about 32,300 owner-planters who cultivate around 36,800 hectares of land.

The value added generated by the sugar industry is attributed, for national accounts purposes, to the following industrial activity groups.

- Agriculture : the final product is sugar cane. Both millers and planters are engaged in its production.
- Manufacturing : the final product is sugar and its by-products, molasses, saccharin and electricity. Only millers are engaged in this activity.
- Transport : includes only the millers' own account transport of sugar cane, sugar and other inputs and
- Distribution : includes activities of brokers, shippers and the Mauritius Sugar Syndicate.

Methodology

The period from the growing stage to the marketing of all sugar produced covers eighteen months. For national accounts purposes, valuation is done on an accrual basis, so that production relating to crop year n-1/n is treated as production for the calendar year n-1. For example, production of crop year 1989/90 is included in the accounts of calendar year 1989.

Sugar is marketed solely through the Mauritius Sugar Syndicate. This agency provides data on sales of sugar, both local sales and exports' proceeds, for each crop year. All the expenses incurred in respect of marketing are also given.

All the sugar estates with factories furnish detailed data on their expenses to the Mauritius Chamber of Agriculture which compiles and presents the data in the statements:

- "Analysis of expenditure of Sugar Estate with Factories" and
- "Analysis of production costs"

copies of which are submitted to this office. The items of expenditure therein are scrutinized and then allocated to the intermediate expenses of the respective industries namely Agriculture, Manufacturing, Transport and Distribution. Separate production accounts are prepared for each of these activities.

Agriculture: The end product is sugar cane. Separate accounts are prepared in respect of millers and planters.

The gross proceeds from the sale of sugar and its by-products are obtained from the Mauritius Sugar Syndicate. The gross output of agriculture comprises 75% of the gross proceeds as the remaining 25% accrues to millers to cover the milling cost.

Intermediate expenses in respect of sugar cane cultivation owned by millers are extracted from the statements provided by the Mauritius Chamber of Agriculture. No such data exist for planters, therefore an estimate of their production cost is worked out at the office. The country is divided into four main regions and detailed production cost per acre-plant is prepared regionwise based on information collected from personal interviews of planters. Intermediate consumption for the total acreage cultivated by planters is then computed. The estimate also takes into consideration expenditure incurred on new plantations - a 'learning' cycle of 10 years is assumed.

Manufacturing: The end product is sugar and only millers are engaged in its production. The gross output is worked out from the gross proceeds of sugar. The main item under goods consumed is sugar cane; other inputs include milling cost and marketing expenses which are obtained from the Mauritius Chamber of Agriculture and the Mauritius Sugar Syndicate.

Transport: The sugar estates and millers provide their own means of transport. Most of their canes, sugar and other inputs are transported by their own lorries. The 'Transport' activity is valued at cost. The expenditure incurred in respect of purchases of materials and services, compensation of employees and consumption of fixed capital are obtained from the statement, "Analysis of expenditure of Sugar Estates with Factories". The total of these aggregates gives the gross output. Transport cost is then imputed, on a pro-rata basis, to the intermediate consumption expenditure of the agriculture and manufacturing sectors.

Distribution: The gross output is computed from the related expenditure items as given in the Mauritius Sugar Syndicate report. The cost component consists mainly of elements of value added.

1.3 Mining and quarrying

The activity of mining and quarrying covers salt production and sand quarries. The share of this industry in the Gross Domestic Product is negligible.

Estimates of gross output and value added are made based on information collected through special enquiries.

1.4 Manufacturing

The share of the manufacturing sector in the economy has constantly been increasing following the rapid development of the Export Processing Zone sector (EPZ). Manufacturing enterprises contributed about 23% to the Gross Domestic Product in 1991 compared to 15% fifteen years ago.

Methodology

The manufacturing sector is more conveniently analysed under the following four broad groups :

- (i) Sugar
- (ii) EPZ enterprises
- (iii) Development Certificate enterprises
- (iv) 'Other' enterprises

Sugar: Production account in respect of sugar milling is prepared from annual reports of the Chamber of Agriculture and from financial statements of the Mauritius Sugar Syndicate as explained in section 1.2.

EPZ, DC and the 'other' establishments are surveyed twice a year through the Census of Industrial Production.

At the beginning of the year, a simplified questionnaire (C.I.P.I.) is sent to all the large establishments requesting information on the quantity of goods produced and their sale value. The value of production or gross output is then derived from the sales figures. A crude estimation of the value added for the current year is then calculated using the working ratio - value added/gross output worked on the previous years' figures - Value added in respect of non-respondents is estimated using indicators available for example employment, imports of raw materials and exports of finished goods.

In September, a detailed questionnaire is sent, which collects information on employment, labour costs, inputs, sales, stocks and investment. These forms are edited for completeness and consistency. Production accounts are worked out for each of the ISIC groups.

Technical ratios such as labour costs/gross output, value added/gross output and labour costs/value added are also calculated. These are used to make estimates for the non-respondents and also help in forecasting exercises.

The response rate to our enquiries has varied around sixty per cent during the past years. However, in terms of gross output this accounts for nearly eighty per cent.

All the economic data relating to the Manufacturing Sector have been assembled in a separate annual publication - The Digest of Industrial Statistics.

1.5 Electricity, gas and water

This sector covers the activities of two public enterprises only.

- The Central Electricity Board (C.E.B.) and
- The Central Water Authority (C.W.A.)

The generation and distribution of electricity throughout the island is undertaken by the C.E.B. and the C.W.A. is responsible for the storage and supply of water.

These two para-statal bodies regularly publish their income and expenditure accounts, so that data required to prepare their production accounts are readily available. Nevertheless, they also have to fill in two questionnaires which are sent to them every year. The first relates to production and asks for detailed information on receipts, employment and labour costs, purchase of goods and services (local and imported) and stocks of materials. The second questionnaire relates to investment on fixed assets. Data acquisition of assets such as buildings, plant, machinery and transport equipment are collected for the preparation of the table on gross domestic fixed capital formation by type of goods.

A special mention must be made of the C.E.B.'s report which contains useful statistical information. For example, the table giving the breakdown of sales figures by category of consumers helps in estimation of electricity consumed by other industries.

1.6 Construction

The construction industry consists of the activities of:

- General builders and civil engineering contractors
- Small contractors and special trade contractors
- Public authorities engaged in capital works - Ministry of Works, Local Authorities and the Development Works Corporation
- Own-account construction carried out by individuals

Methodology

The gross output of the construction industry is the value of investment on residential and non-residential buildings, roads, electricity and communications networks, land improvement and reclamation, maintenance and repair services, etc. The methodology adopted varies with the type of construction and the source of statistical information.

The main source of data is the records of building permits kept by the Ministry of Works and the local authorities. The total volume (floor area) of building construction, whether performed by contractors or individuals, is compiled at the office, from these records.

A few 'small' contractors are interviewed to obtain the price charged per square metre for the construction of dwellings and its breakdown into labour costs and materials consumed. Several such prices are worked out because the cost of construction varies with the size and location of the building.

Similarly, builders and contractors are surveyed to obtain cost of projects completed during the year. These data are supplemented with investment statistics which are collected for the computation of the fixed capital formation.

The capital work performed by the Ministry of Works, local authorities and the Development Works Corporation are also included in the construction industry. Data on their activities and expenses are obtained from their respective accounts and also from the financial report of the Accountant-General's Department. Hence production accounts are prepared for the private and public sector.

Another element of the construction industry is the repair and maintenance of buildings, both residential and non-residential, performed by the various contractors and public authorities. Estimates are made from benchmark data from:

- (i) stock of buildings up-dated from 1983 Housing Census
- (ii) repairs and maintenance expenses by households from Household Expenditure Surveys
- (iii) maintenance costs by industries obtained from returns of the annual Census of Industrial Production

Some items of intermediate consumption, e.g. aggregates, paints, cement, iron bars, are cross-checked with production and imports statistics.

1.7 Wholesale and retail trade, restaurants and hotels

This group contributes around 17% to the Gross Domestic Product of the country. It includes the activity of the distributive trade, hotels and restaurants.

Imported goods: The basic data used for the computation of wholesale and retail margins on imported goods are obtained from the annual tabulations on imports. Imports are classified itemwise according to the Standard International Trade Classification (S.I.T.C., Revision 3) and for each item the quantity, C.I.F. value, customs and fiscal duties are given. These data are first grouped into broad economic categories namely intermediate, final consumption and capital goods. Formerly, lists of consumption goods which were controlled by the Ministry of Trade and Shipping were furnished to this office together with their respective margins. Since prices are no longer controlled, margins are now estimated as the difference between the 'landed cost' and the retail price.

Locally manufactured goods: Wholesale and retail margins are estimated using the commodity flow approach. The volume and value of goods manufactured are obtained from the annual Census of Industrial Production conducted by this office. These products are valued at ex-factory prices. The retail prices of these goods are collected from the Consumer Price Unit of this office and the value of these products at purchasers' prices is worked out. Gross output is then obtained as the difference between the final purchasers' prices and the ex-factory prices of the goods.

Agricultural products: A similar approach as described for locally manufactured goods is used. The main source of data is agricultural statistics compiled at this office. Agricultural products are valued at producers' prices.

Other activities: Estimates are also made in respect of margins obtained by lottery and pool organisers, auctioneers and scrap metal dealers. Data in respect of lottery organisers are worked out based on information obtained from the Accountant-General's Department.

Intermediate costs incurred by the distributive trades are estimated on the basis of information collected from different sources. Income tax statistics and special enquiries provide indicators on the cost structure. The distributive trades consume a lot of the output of paper industries, e.g. transport, books and stationery, accounting and advertising. The gross output of these service industries is first worked out and an estimate of the amount incurred by the distributive trade is made on a percentage basis.

A production account is then worked out from the aggregated data on gross output and intermediate consumption expenditure.

Hotels and Restaurants

All the hotels and some of the restaurants are surveyed by mail questionnaires. Information is asked on receipts from sales of food and beverages, letting of rooms and bungalows, etc. The breakdown of the intermediate cost includes such items as purchase of foodstuff and beverages, compensation of employees, cost of electricity and water.

The number of room nights/beds nights spent during the year is also known. As the response rate is low, the survey data are only used to provide indicators on the hotel activity. A production account is worked out on the basis of gross output, intermediate consumption, and value added per tourist night.

The total tourist nights spent during the year is compiled by the Tourism Unit of this office. A global figure on gross output and value added is then worked out using the above mentioned derived rates.

The total number of restaurants and cafes operating is obtained from the register of licence holders compiled by the Local Authorities. Estimates of gross output, intermediate cost and value added per restaurant are made, based on information collected from personal interviews of a few owners of restaurants and cafes.

It must be pointed out that consistency checks are performed on the aggregates. Total receipts of hotels and restaurants are compared with a percentage of tourist earnings. Expenditure pattern of tourists is known from an 'Airport Survey' conducted jointly by this office and the Mauritius Government Tourist Office. Total tourists earnings are obtained from the Bank of Mauritius.

1.8 Transport, storage and communication

This group contributes about 12% to the Gross Domestic Product and covers a wide range of activities grouped under the following:

- Land transport
- Sea transport
- Air transport and travel agencies
- Docks and stevedoring services
- Communication services

Methodology

Land transport: The enterprises in this activity consist of operators of buses, lorries, vans, contract cars and taxis.

The large establishments namely the bus, lorry and contract car companies are interviewed by mail questionnaire. Gross output, intermediate consumption and labour costs per vehicle are then worked out. The total number of buses, lorries and contract cars operating is obtained from the National Transport Authority. The rates indicated above, are then applied to these totals and estimates of total gross output, intermediate consumption and value added are derived. A similar method is used to estimate the gross output and value added of taxis and vans. Information on income and expenditure per vehicle is obtained from personal interviews of taxi and van owners. The estimates of gross output for buses and taxis are cross-checked with data on consumption obtained from Household Expenditure Surveys.

The production account for lorries engaged in the transport of sugar cane and sugar is worked out separately, as explained in section 1.2.

Sea transport: Ship owners and shipping agents are interviewed by mail questionnaire. As very scarce information is obtained from this source, indirect methods are used to estimate output. Indicators such as volume of goods loaded and unloaded and statistics on movement of ships are used.

Air transport and travel agencies: The main enterprise engaged in this activity is the Air Mauritius. Data on sales of tickets, handling charges, compensation of employees, fuel costs and other expenses are obtained through a mail questionnaire. Information on the operation of travel agencies is obtained from direct enquiries. Estimates are made for non-response and small units not covered by the annual survey. The activities of the Civil Aviation Department, which is one of the government industries, is also included here. The relevant information for the preparation of its production account is obtained from the Financial Report of the Accountant-General's Department.

Docks and stevedoring services: Establishments engaged in these activities employ more than 10 persons. There are the Mauritius Marine Authority and the Mauritius Sugar Mill Terminal Corporation and the Cargo Handling Authority. Information required for the estimation of gross output, intermediate consumption, value added, etc. is obtained through mail questionnaires. The report of the Mauritius Marine Authority also provides useful information relating to port and harbour services.

Communication services. This section comprises mainly the government industries namely the Post and Telegraphs Department and the Telecommunications Department. The Financial Report and the monthly abstracts of accounts prepared by the Accountant-General's Department are used to compile the required statistics of the Production Account. The only private enterprise included in this group is the Overseas Telecommunications Services Co. Ltd. Information on the operation of this firm is obtained directly through a mail questionnaire.

1.9 Financing, insurance, real estate and business service

This group covers activities of financial institutions and insurance companies, real estate agencies and units providing business services.

Separate production accounts are prepared for activities grouped under the following:-

- Financial institutions
- Insurance
- Real estate
- Business services

The Central Bank. The Bank of Mauritius is interviewed by mail questionnaire to collect expenditure data on compensation of employees and the purchase of goods and services. Its gross output is then imputed, based on 'profits' annually transferred to Government.

Commercial Banks and other financial institutions. Data on the activities of commercial banks are now obtained through direct enquiries from the commercial banks.

The gross output of commercial banks and similar financial institutions is defined in the SNA Manual as the sum of actual service charges and imputed service charges. Actual service charges consist of income from dealings in foreign exchange, commissions, ledger fees etc. Imputed service charges are equal to the excess of interest received over interest paid. Imputed banking service charges must in theory be allocated on a proportional basis to all industries. This procedure involves the collection of detailed figures on credits and deposits which are not easily obtained from the banks. The new SNA manual recommends that the service charges are instead allocated to a nominal banking institution which therefore shows a negative value added. This is the procedure now adopted for the presentation of the estimate.

Estimates of value added in respect of other financial institutions e.g. the Mauritius Pounding Corporation, the Sugar Industry Pension Fund are also made along the same line as explained above.

Insurance: Special questionnaires have been designed to collect the required statistics from the insurance companies. Data supplied are used to prepare separate accounts in respect of casualty and life insurance.

The gross output of casualty insurance is calculated as the difference between premiums received and claims paid. This service charge is allocated to the industries in the same proportion as premiums paid by each industry. Details on premiums collected by each class of insurance are obtained from the Registrar of Insurance Report.

The gross output of life insurance is obtained by deducting from premiums received, the claims paid, to which is added the 'net' additions to actuarial reserves exclusive of interest received. Life insurance services are not charged to the production accounts because they are treated as an element of savings and appear in the capital accounts. Estimates of value added which comprise mainly commissions received is also made in respect of assurance agents.

Real Estate: This group comprises the actual and imputed rent of owner occupied dwellings as well as the activities of agencies involved in sale of property.

The stock of dwellings distributed by size and region is obtained from the 1983 Housing and Population Census. These benchmark data are updated, using the number of building permits issued every year by the Ministry of Works and the local authorities. Information on rent paid by size of dwellings is obtained from the quarterly Rent Survey conducted by this office. These rents are applied to the total number of residential buildings and the current market value of the existing stock of dwellings is thus computed. This valuation differs from that used in the national income table, additions during the year were valued at current market prices and then added to previous year's figures. To this imputed rent, the actual rent paid in respect of non-residential buildings is added. Data on rent paid is obtained indirectly from Income Tax Statistics and returns of establishment surveyed by this office. The total gives the gross output of activities classified in 'Real estate'. The intermediate cost which consists mainly of expenditure on repairs and maintenance is estimated as a percentage of the gross output.

Business services: This group covers activities of a few large business enterprises, such as engineering firms, advertising agencies, computer and accounting firms which are interviewed by mail questionnaire. It also includes the services provided by own-account professional workers such as lawyers, accountants, notaries, surgeons, etc. The income approach is used to estimate gross output which consists mainly of compensation of employees and operating surplus.

1.10 Producers of government services

'Producers of government services' is one of the three classes of transactors in the Production Account. It consists of the following:-

- Most ministries and departments of the central government
- All departments of local authorities (except the Public Works Committee)
- Non-profit institutions which are entirely or mainly financed by the government

Methodology

The government accounts are prepared by the Accountant-General's Department on a financial year basis and are published in the Financial Report. For National Accounting purposes, income and expenditure have to be compiled on a calendar year basis. The monthly abstracts of accounts kept by the Accountant-General's Department are extensively used in this respect.

The expenditure items contained in the Recurrent Budget are carefully scrutinized and then classified in categories as defined in the SNA manual, for example compensation of employees, intermediate consumption, capital formation, transfers. Likewise, items of expenditure in the Capital Budget are carefully examined and classified mainly under capital formation and intermediate consumption.

Ministries, departments and institutions included in 'Producers of government services' are classified according to the ISIC groups as follows:-

Agriculture, hunting, forestry and fishing consist of all expenses (excluding administrative) incurred by the departments of Agriculture, Forests and Fisheries. Expenditure on research and experimentation from the Capital Budget are also included.

Public administration and defence includes the administrative expenses of the Ministry of Agriculture, Ministry of Health, Ministry of Education and all other ministries and departments performing administrative work only. The administrative work of the local authorities and of the Private Secondary Schools Authority are also included here.

Sanitary and similar services includes the expenses of the Public Health Department, sewage disposal and other sanitary services and the 'Public Health Committee' of local authorities.

Social, recreational and related community services includes the expenses of the following departments in the Recurrent Budget: schools and colleges, hospitals and laboratory, vocational training, Unemployment Board, Fiji Relief Scheme, National Pension Division, social welfare and Social Aid Divisions, Archives, Mauritius Institute, Government Hotel and Catering Training School, Mauritius Government Tourist Officer and the Youth Guidance Service.

Also included are the expenses of the 'Private Sector Committee' of the local authorities and expenses incurred by the University of Mauritius, the Mahatma Gandhi Institute, the Mauritius College of the Air, the Mauritius Institute of Education and the Mauritius Examinations Syndicate.

It is to be noted that the following departments whose accounts appear in the Financial Report are not classified under 'Producers of Government services', but included in 'Industries':

- Printing Department
- Building and repair activity of the Ministry of Works
- Post and Telegraph Department
- Civil Aviation Department
- Post Office Savings Bank

1.11 Community, social and personal services.

This section deals with community, social and personal services included under 'Industries' and 'Non-profit' services to households performed by private enterprises. Similar activities undertaken by government are classified in 'Producers of government services'. The main services included are :

- Educational services,
- Medical, dental and other health services
- Personal and household services (repair of motor vehicles, repair of footwear, laundry services, etc.)
- Motion picture and other recreational services,
- Miscellaneous personal services.

Methodology

Computation of gross output, intermediate consumption and value added in respect of the service industries involves a lot of estimation work using different statistical techniques, such as the income approach and the production approach. Most of the private enterprises engaged in the provision of community, social and personal services are small and their owners do not keep proper records of income and expenditure. Therefore, collection of data cannot be done by mail questionnaire. The necessary information is obtained from personal interviews, administrative records kept by ministries and government departments and the results of the censuses and surveys carried out by this office.

As the gross output of most of the service industries consists principally of compensation of employees and profits, the income approach is most often used. Data on number of persons engaged in each type of service activity are collected and appropriate average rates applied to obtain the yearly income. The register of licence holders, the registers of employers and employees of the National Pension Scheme and the Bi-Annual Survey of Employment and Earnings prove most helpful in this respect. These figures are supplemented with benchmark data on occupation and economic activity obtained from the 1983 Housing and Population Census. The value added generated from the provision of private medical and dental services, hairdressing, private tuition, recreational and amusement services, etc., are estimated along the lines mentioned above. These estimates are then cross-checked with data on consumption of services obtained from Household Expenditure Surveys.

Various other methods are used to estimate the output of services where the income approach cannot be used. Two of these methods are described below.

For establishments engaged in repair of vehicles, the output is worked out from a table prepared on 'age' distribution of vehicles registered. Repair cost per vehicle which vary with the 'age' of the vehicles are estimated and applied to the total number of vehicles in each 'age' group to obtain the gross output. The estimates of intermediate consumption expenditure are based on import figures of spare parts, lubricants, and other materials used in repair works.

In the case of establishments which keep proper records and where the information can be readily obtained by means of mail questionnaires, the production approach is used. Among these are the Private Secondary Schools Authority, the Mauritius Broadcasting Corporation and some large establishments such as private citines, laundry services and large motor vehicle repair workshops. From returns provided by the Private Secondary Schools Authority, the output of private colleges which accounts for a large proportion of the service industries, is readily estimated.

2. Cost Components of the Gross Domestic Product

Value added at market prices comprises compensation of employees, operating surplus, the consumption of fixed capital and the excess of indirect taxes over subsidies. Operating surplus is termed "gross" because it includes the element of consumption of fixed capital.

Compensation of employees comprises all payments by producers of wages and salaries, including payments in kind as well as in cash, and contribution to Social Security and Pension Funds.

When the production approach is used to calculate value added data on compensation of employees are readily available from the questionnaires. Whenever the income approach is used, the number of persons employed is first obtained. The main sources are the Survey of Employment and Earnings, the National Pension Scheme and the Population Census data.

Appropriate wage rates are then applied to the employment data to obtain estimates of compensation of employees.

3. Gross Domestic Fixed Capital Formation

Gross Domestic Fixed Capital Formation (GDFCF) is one of the main aggregates of expenditure on the Gross Domestic Product. It consists of the value of durable goods intended for non-military purposes each of more than Rs 5,000 in value, acquired by resident producer units and meant to be used for a period of more than one year.

Capital formation of industries and producers of government services corresponds to the net additions to their fixed assets, whereas for households only expenditure on construction of dwellings is included. Household expenditure on durable goods such as cars, refrigerators, washing machines, etc., is treated as final consumption although the acquisition of similar goods by industries or government are considered as capital goods.

Methodology

Different methods are used for the valuation of capital formation based essentially on the commodity approach. Information on investment are collected and compiled on a calendar year basis. These data are classified by type of capital goods such as residential buildings, plant, equipment, machinery and equipment, and by industries are shown in the table 4.1.

In 1991 around 52% of the GDFCF consisted of investment in buildings and other construction works. The number of permits issued and corresponding floor areas for new buildings, additions and reconstructions are obtained from building permits statistics.

All building permits intended for residential purposes are compiled separately and grouped under 'Residential buildings'. Small contractors are interviewed to derive average cost of construction per square metre charged for dwellings. This cost varies with the location and the size of the building. The value of the investment in residential buildings is then obtained as a product of the floor area and the appropriate cost per square metre. To this investment of the private sector is added the value of construction of dwellings undertaken by the public sector. This information is readily available from the Central Building Authority and the Mauritius Housing Corporation.

Similarly, investment by the private sector on non-residential buildings is computed. The volume of construction is compiled from building permits statistics and the value of projects completed during the year obtained from questionnaires sent to large contractors. Sugar estates and parastatal bodies are interviewed by mail questionnaires that provide data on the value of construction and major repair works undertaken yearly. Expenditure on non-residential buildings constructed for the central government are obtained from figures of capital expenditure in the Financial Report.

All other construction works not included above are grouped under 'other constructions' and works. These include outlays on road constructions, dams, reservoirs, pipe laying, electric distribution networks, land improvement and reclamation and all other civil engineering works. Also included here is expenditure made on young tea plantations. Information on such construction works is obtained from questionnaires sent to the bodies concerned.

Machinery and equipment, accounted for 46% of the GDEGP. As most of the machines are imported, external trade statistics is the main source of data. A list of imported machinery and equipment, identified as capital goods, is prepared. These imported goods are obtained at C.I.F. value and are brought to purchasers' prices by the addition of indirect taxes, stamp duties, landing cost, transportation cost, import duty and retail margins and in some cases installation cost. They are then classified by industrial use based on information collected from parastatal bodies, sugar estates, and imports of the export processing enterprises, etc.

Machinery and equipment imported by government are also obtained from external trade statistics. These are however incorporated in the expenditure data in the Financial Reports.

Establishments producing machinery and equipment are also surveyed and their gross output provides data on investment in local machinery and equipment.

Data used in the compilation of capital formation tables are obtained from many sources; great care should therefore be exercised at the compilation stage in order to avoid double counting.

4. Estimates at Constant Prices

4.1 General

The National Accounts of the country as explained earlier are initially prepared at current prices. For many analytical purposes, estimates are required which are free from the effects of changes in prices. Working at constant prices allows the study of volume or real growth of a particular sector of the economy.

A 'normal' year is usually selected to represent the base year and the 'quantity' produced in the subsequent years are either revalued at the base year price or the value of goods produced during the current year are deflated by an appropriate price index (deflator).

4.2 Double-deflation method

The value added or the net output of an industry is a residual obtained after subtracting its intermediate consumption from the gross output. Therefore, to obtain the value added at constant prices, both the gross output and the input of goods and services should be measured at constant prices. This method, the ideal one, is known as the "double-deflation" method. However, this method requires extensive data on both inputs and outputs which, in practice, are very difficult to obtain. Therefore, other methods using 'proxy' indices are used to indicate volume changes. The proxy indicators most often used are:-

- (a) Physical quantities of good produced
- (b) Physical quantities of materials used
- (c) Empirical

As most industries produce a large number of heterogeneous products it is not possible to obtain separate physical output or input series. The value series are most often deflated by an appropriate price index to obtain a constant price estimate. The indexes normally used are:-

- (i) Producer Price Index (P.P.I.)
- (ii) Consumer Price Index (C.P.I.)
- (iii) Construction Price Index
- (iv) Wage/Salary Index
- (v) Import and Export Price Index

A brief description of the methodology used to work out the production account (at constant price) for industry group is given in the following table:-

<u>ISIC Group</u>	<u>Industry Group</u>	<u>Method used</u>
1	Agriculture, Hunting, Forestry and Fishing:	
	Sugar and Tea	Double deflation method
	Other	Use of quantity relatives to extrapolate base year value added
3	Manufacturing:	
	Sugar and black tea	Double deflation method.
	E.P.Z.	Deflation by specific price indices such as export price index or weighted index of inputs and salary
	D.C. and other	(i) Quantity relatives for homogeneous products; (ii) Deflation by specific retail price indices for the majority of products groups.
4	Electricity, gas and water	Double deflation method.
5	Construction	Deflation by a weighted price index of inputs and a salary index. Building permits statistics also used as indicator.
6	Wholesale and retail, restaurants and hotels:	
	Wholesale and retail	Deflation by weighted index of the Consumer Price Index and Import Price Index.
	Restaurants and hotels	Extrapolation of the base year value added by tourist nights series.
7	Transport, storage and communications	(i) Deflation by a price index of bus fares, taxi fares or a retail price index of fuel; (ii) Deflation by a salary index or extrapolation using an index based on registration of vehicles.

<u>ISIC Group</u>	<u>Industry Group</u>	<u>Method used</u>
8	Insurance, finance and business services	(i) Deflation by a weighted salary index and Consumer Price Index; (ii) Extrapolation using index based on employment data.
9	Producers of government services	(i) Deflation by a salary index; (ii) Extrapolation using index based on employment data.
10	Other services	Extrapolation by an employment index.

4.3 Expenditure approach

The methods used for the estimation of C.D.P. at constant prices by type of expenditure are as listed below:

<u>Type of expenditure</u>	<u>Method used</u>
1. Private consumption expenditure	The Consumer Price Index adjusted for coverage.
2. Government consumption expenditure	Deflation by a weighted index of salary and Consumer Price Index.
3. Capital formation	
(a) Buildings, construction and other works	Deflation by a weighted price index of main inputs such as cement and iron bars and a salary index.
(b) Machinery and other equipment	Deflation by the price index of imported capital goods
(c) Changes in stocks	Deflation by the imports price index.
4. Exports and imports of goods and services	Deflation by the export and import price indices.
5. Indirect taxes:	
(a) for commodity taxes such as excise duty and export duty	Quantity relatives based on production data
(b) for other taxes e.g. import duties and sales tax	A price index based on increase in the rates of the specific duties or the G.D.P. implied price index.

'Deflators' or price indices are now computed on an 'ad hoc' basis. The availability of series of detailed data on inputs will enable the construction of specific price indices as for example a producers' price index or an input price index for agriculture or industries.

The availability of series of properly constructed specific price indices will further improve the calculation of estimates at constant prices.

5. Institutional Sector Accounts

5.1 Institutional Sectors

For the purpose of the analysis of production, the economy is split into industry groups but to analyse flows affecting income, capital and financial transactions, the different units involved in production, redistribution and consumption are grouped into 'institutional sectors' as follows:-

- (i) Households
- (ii) Financial and non-financial corporate and quasi-corporate enterprises
- (iii) General Government and
- (iv) Rest of the World.

5.2 (i) Households: The household sector covers:

- (a) individuals as consumers
- (b) entrepreneurs, proprietors and partnerships
- (c) non-profit institutions (N.P.I.) serving households.

The main resources of the N.P.I's are usually derived from voluntary contributions of households and from property income.

(ii) Financial corporate enterprises include the Central Bank, commercial banks, other monetary and credit institutions and companies engaged in insurance.

Non-financial corporate enterprises cover all private or public companies and public corporations which are principally engaged in the production of goods and non-financial market services.

(iii) General Government comprises:

- (a) most ministries and departments of the central and local government (Civil Aviation, Post and Telegraphs and Telecommunication Department are classified under public enterprises)
- (b) Social Security Schemes and
- (c) Non-profit institutions entirely or mainly financed by government.

(iv) Rest of the World. The rest of the world accounts provide an overall view of the economic relationships linking the national economy with the rest of the world.

SYMBOLS AND ABBREVIATIONS

SYMBOLS

The following symbols are used throughout:

- : Not applicable or nil

... : Not available

ABBREVIATIONS

Rs : Mauritian rupees

Rs Mn : Rupees Million

000 : Thousand

M/T : Metric tons: 1,000 kilos

H/Litres : Hectolitres: 100 litres

Mn/kwh : Million kilowatt/hour

No. : Number

E.P.Z. : Export Processing Zone

ISIC : International standard industrial classification of all economic activities

C.I.F. : Cost, insurance, freight

F.O.B. : Free on board

EXCHANGE RATE

Conversion rate to Special Drawing Rights (S.D.R.):

1 S.D.R.: 7.713759 Mauritian Rupees up to 23rd October, 1979

1 S.D.R.: 10.00 Mauritian Rupees as from 24th October, 1979

1 S.D.R.: 12.00 Mauritian Rupees as from 28th September, 1981.

On the 28th February, 1983, the Mauritian Rupee was delinked from the S.D.R. and linked to a trade-weighted basket of currencies.

SECTION II - INSTITUTIONAL SECTOR ACCOUNTS
Explanatory Notes

(i) Integrated Economic Accounts of the Nation

The Integrated Economic Accounts of the Nation presents in a concise form (in the form of a T table), the Production, Income and Outlay and Capital/Finance Account of the Institutional Sectors of the economy. The Institutional Sectors are: the Enterprise, Household, Government and the Rest of the World. A column referring to Goods and Services has been added to show the equilibrium on goods and services and for balancing the table.

Each column represents an institutional sector. Receipts are recorded on the right whilst payments are shown on the left. For example in 1987 the enterprise sector received Rs 27,857 million in gross output and used Rs 16,757 million for the purchase of intermediate goods and services and Rs 5,310 million was paid as compensation of employees.

Each line represents a transaction or a residual balancing item. Gross value added, gross operating surplus, gross disposable income, gross savings and gross lending/borrowing are balancing items derived from the accounts.

The balancing item appears twice, once as a resource and as a use. For example gross operating surplus is calculated in the production account as the difference between value added and compensation of employees and indirect taxes. It therefore appears on the left in the production account. Gross operating surplus also constitutes a resource for the Income Account, it therefore appears on the right in that account.

One important balancing item is lending (+)/borrowing (-). A positive sign means that the sector has an excess of resources and can lend to other sectors while a negative sign indicates a need for borrowing fund from other sectors. The total of this line is zero. For example from Table 2.1, we can see that in 1987, both the Household Sector and the Government Sector had an excess of Rs 752 million and Rs 463 million respectively whilst Households and the Rest of the World had to borrow Rs 510 million and Rs 703 million respectively.

Data on current and capital transfers of the Government sector have been compiled from the Accountant General's Report as these data are different from those appearing in the Balance of Payments accounts prepared by the Bank of Mauritius. The Rest of the World sector therefore does not tally with those of the Balance of Payments.

The Capital Account has been prepared on the basis of provisional data and will be revised in the light of more reliable information on "land transfers" and "capital transfers" obtained later. Also, it has not been possible to include the Financial Account in the table because of the limited data available on Financial flows between Institutional Sectors.

(ii) Institutional Sector Accounts

Classification

Income and Outlay Accounts provide useful information on the consumption, disposable income and savings of the economic agents of the country. The economic agents also called institutional sectors have been grouped as follows:

- (i) The Household Sector: This sector comprises not only of households but also of the unincorporated enterprises e.g. planters, shop owners and of the non-profit institutions serving households e.g. the Red Cross Society.
- (ii) The Government Sector: This sector comprises of all departments and Ministries of central and local government, social security schemes and other bodies mainly financed or controlled by government.
- (iii) The Enterprise Sector: This sector comprises of both the financial (Panks, insurance companies) and of the non-financial enterprises; and
- (iv) The Rest of the World Account which presents a summary of all the external transactions of the country.

(iii) Data Limitations

Data on income and expenditure flows in respect of each of the sectors mentioned above are very scarce because of the high non-response rate in this area.

The preparation of these tables have required much estimation work based on indirect methods. The Income Tax statistics tabulations, the annual reports of companies and banks were very useful sources.

It has therefore not been possible to check the reliability and consistency of the individual entries and of the balancing item "Gross Saving".

A few amendments have been made to gross operating surplus and property income of the enterprise and the household sectors for the period 1986 - 1989. A new set of Integrated Economic Accounts and Income and Outlay accounts incorporating these changes have been prepared and are included in the report.

The tables are provisional and will be revised in the light of information on financial flows after the completion of the Capital Accounts.

EQUIVALENT PURCHASING POWER

SECTION V: INPUT - OUTPUT TABLE - 1987

1. Introduction

An Input-Output (I.O.) table provides a snapshot picture of the economy for a particular year. It is a matrix representation of all economic transactions during a given period as compiled for National Accounts purposes. The row entries show how the output of each industry is distributed among other countries and sectors of the economy. At the same time, the column entries show the inputs that each industry buys from other industries and sectors.

The I.O. table compiled for the year 1987 is a simplified one; all economic activities have been summarised into 15 industry groups only.

2. Methodology

2.1 The construction of the Mauritian Input-Output table is based on the concepts and definitions recommended by the United Nations through its manual 'A System of National Accounts' (1968).

2.2 Main Assumptions

The use of the I.O. table is based on two main assumptions known as homogeneity and proportionality. The homogeneity assumption required that each sector produces a single output with a single input structure. The proportionality assumption states that the inputs of each sector vary in direct proportion to that sector's total output.

2.3 Valuation

All inputs and outputs in the I.O. table are valued at producer's prices (i.e. exclusive of trade and transport margins). In the case of trade activities output is defined as 'gross margins' i.e. mark up on the goods handled, by trade establishments rather than the total value of all transactions.

3. Data Sources

Detailed data required for the construction of the I.O. table were collected mainly through the 1985-1986 Census of Economic Activities and the 1987 Census of Industrial Production.

4. Salient features

4.1 Gross Domestic Output

In 1987, the Mauritian economy produced around Rs 41,400 million worth of goods and services. The goods sector accounted for slightly over 60 per cent and the services sector, the remaining 40 per cent. The major industry was Manufacturing, which contributed 41 per cent of the total gross domestic output. It was followed by Wholesale and Retail Trade including Restaurants and Hotels with 11 per cent; Transport, 10 per cent; Agriculture 9 per cent and Finance and Business Services, 9 per cent.

A large proportion of the gross domestic output (Rs 30,700 million) or 74 per cent was sold to the Final Demand Sector which comprise Exports, Household and Government Consumption and Gross Capital Formation. The remaining Rs 10,700 million or 26 per cent was sold to industries as intermediate inputs.

Exports of goods and services which amounted to some Rs 15,000 million constituted the major destination of gross domestic output. It accounted for 36 per cent of total output and 49 per cent of all final demand reflecting the economy's export orientedness. Exports of goods amounted to Rs 11,395 million or 76 per cent of total exports, the major products were EPZ goods (Rs 6,067 million or 44 per cent) and sugar (Rs 4,409 million or 29 per cent). Exports of services, totalled Rs 3,594 million representing 24 per cent of total exports.

Household consumption of locally produced goods and services amounted to nearly Rs 9,800 million representing 68 per cent of total household consumption. Government consumption stood at Rs 2,760 million.

Capital Expenditure also known as Gross Domestic Fixed Capital Formation which consists mainly of expenditure on locally produced machinery and construction amounted to Rs 3,206 million inclusive of an increase in stock of goods estimated at around Rs 440 million.

4.2 Inputs

... Local Intermediate Inputs

Intermediate inputs supplied to domestic industries amounted to Rs 10,700 million representing 26 per cent of total output. The goods sector, being the major supporting industries accounted for 74 per cent of this and the Services sector, the remaining 26 per cent.

Agricultural activities contributed 30 per cent of all domestically produced inputs and was almost entirely used by the Manufacturing sector especially sugar milling.

Manufacturing activities contributed 23 per cent of all inputs and 48 per cent of this was used by itself. It also contributed 41 per cent of all domestically produced inputs used by Agriculture, 44 per cent used by Construction and 15 per cent used by the Services sector.

... *Imported Inputs*

Imported goods and services used by industries in their production processes amounted to Rs 9,871 million (inclusive of import duties and sales tax) and represented 24 per cent of total output. The goods sector used 73 per cent of these imported inputs with Manufacturing alone, especially EPZ, accounting for 61 per cent. The Services sector used the remaining 27 per cent.

... *And Value Added*

Payments for primary inputs or what is commonly known as value added, the total of which gives Gross Domestic Product (G.D.P.), amounted to Rs 20,825 million representing 50 per cent of total output.

Compensation of employees accounted for 43 per cent of G.D.P.; Gross Operating Surplus, 52 per cent and Other Indirect Taxes (exclusive of import duties and sales tax) the remaining 5 per cent.

The services sector contributed 51 per cent of G.D.P. and the goods sector, 49 per cent. The largest sector was Manufacturing contributing 28 per cent of G.D.P. followed by Wholesale and Retail Trade and Restaurants and Hotels, 15 per cent; Community, Social and Personal Services, 15 per cent; Agriculture, 13 per cent; Finance, Insurance and Business Services, 12 per cent; Transport, Storage and Communication, 10 per cent.
