## DIGEST <br> OF INDUSTRIAL STATISTICS 2008

DIGEST OF INDUSTRIAL STATISTICS 2008

## DIGEST OF INDUSTRIAL STATISTICS - 2008

## Foreword

This is the twenty-fifth issue of a regular publication of the Central Statistics Office on statistics relating to the Industrial Sector. The Industrial Sector, according to the international recommendations for industrial statistics, covers Mining and Quarrying, Manufacturing and Electricity, Gas and Water Supply.

Data presented in this publication cover the period 2001 to 2008. All the figures have been revised in the light of the "2002 Census of Economic Activities".

It is hoped that the data provided will prove valuable to all users, in particular, industrialists, decision makers, planners and researchers. The quality of the data published in this report depends heavily on the basic data provided by numerous enterprises and organisations, both public and private. This office acknowledges their valuable contribution.

## INTRODUCTION

## 1. Historical background

Data on the Industrial Sector were, prior to 1985, published in the annual report "National Accounts of Mauritius". As from 1985, with the emergence of the manufacturing sector, in particular the EPZ, now EOE (as from October 2006), detailed data on the Industrial Sector are published in a separate report, namely, the annual "Digest of Industrial Statistics".

## 2. Data collection, compilation and publication

Data are collected mainly through annual surveys which are later benchmarked with the Census of Economic Activities conducted every five years. The survey data are complemented with administrative data such as imports/exports from the Customs Department and turnover data from Mauritius Revenue Authority. Data are collected under the authority of the Statistics Act 2000, which lays great emphasis on the confidentiality aspect.

Statistics relating to the Industrial Sector are disseminated in two ways. As soon as they become available, they appear in quarterly issues of the following "Economic and Social Indicators":

- The Export Oriented Enterprises (EOE)
- The Producer Price Index - Manufacturing Sector
- The Quarterly Index of Industrial Production (QIIP)
- National Accounts Estimates

Comprehensive data are later published in the annual "Digest of Industrial Statistics".
The status of the figures in this issue of the digest is as follows:

## Year

2001-2006
2007
2008

## Status

Revised and final estimates
Revised estimates
Provisional estimates

## 3. Problems and limitations of published data

The Central Statistics Office continues to face the same problems as mentioned in the previous reports, namely:

## (i) Response rate to the annual enquiries

The response rate to the annual enquiries undertaken by the office continues to improve. However, it appears that the fear that the Central Statistics Office discloses information to other authorities still prevails among some suppliers of data. Data are collected under the authority of
the Statistics Act 2000, which guarantees the absolute confidentiality of all information. No information relating to costs of production, capital employed or profits of an individual enterprise can be revealed to any authority or person. However, the Statistics Act 2000 allows the disclosure of information in the form of a list of names and addresses of individual undertakings or businesses together with their industrial classifications and products or services provided.

## (ii) Non-uniformity of accounting years

Firms do not have uniform accounting years. Data collected for the last twelvemonth period from the different firms may cover up to three consecutive years. Only in some cases, have the data been adjusted to a calendar year basis. This limitation may affect analysis for a particular year, but not analysis of trends over a period.

## 4. Performance of the Industrial Sector: 2004-2008

## (i) The Industrial Sector

The Industrial Sector, which covers Mining and Quarrying, Manufacturing and Electricity, Gas and Water Supply accounted for 31.6 \% of total employment and represented a share of 22.2.\% of GDP in 2008. It registered a growth of $3.3 \%$ in 2008 compared to $2.3 \%$ in 2007. The performance of the sector in 2008 was mainly due to positive growths of 3.6 \% in the EOE sector, 2.9 \% in Non EOE sector, $3.7 \%$ in sugar milling and $4.0 \%$ in electricity, gas and water supply.

Investment in the industrial sector decreased from Rs. 10,515 million in 2007 to Rs. 7,643 million in 2008, that is, by 27.3 \%.

|  | $\mathbf{2 0 0 4}$ | $\mathbf{2 0 0 5}$ | $\mathbf{2 0 0 6}$ | $\mathbf{2 0 0 7}$ | $\mathbf{2 0 0 8}$ |
| :--- | ---: | ---: | ---: | ---: | ---: |
| No of "Large" establishments | 922 | 897 | 837 | 841 | 854 |
| Employment | 104,864 | 95,782 | 94,189 | 97,166 | 97,098 |
| Total value added at basic price |  |  |  |  |  |
| (Million rupees) | 35,575 | 35,630 | 39,978 | 44,839 | 51,922 |
| Share in economy (\%) | 23.3 | 22.0 | 22.0 | 21.7 | 22.2 |
| Growth rate (\%) | +0.9 | -4.6 | +4.0 | +2.3 | +3.3 |
| Investment (Million rupees) | 7,131 | 8,298 | 8,071 | 10,515 | 7,643 |

## (ii) The Manufacturing Sector

Manufacturing within the Industrial Sector covers Sugar milling, Food (excluding sugar), Textiles and Others.

|  | Annual growth rate (\%) |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{2 0 0 4}$ | $\mathbf{2 0 0 5}$ | $\mathbf{2 0 0 6}$ | $\mathbf{2 0 0 7}$ | $\mathbf{2 0 0 8}$ |
| Manufacturing Sector | $\mathbf{+ 0 . 5}$ | $\mathbf{- 5 . 5}$ | $\mathbf{+ 4 . 0}$ | +2.2 | +3.2 |
| Of which |  |  |  |  |  |
| $\quad$ Sugar milling | +10.6 | -9.2 | -2.9 | -13.6 | +3.7 |
| Food (excluding Sugar) | +4.4 | +2.1 | +9.6 | +4.0 | +7.5 |
| Textiles | -7.2 | -14.7 | +2.9 | +8.5 | +0.0 |
| Other | +6.6 | +0.4 | +1.8 | -3.1 | +2.4 |
| $\quad$ EOE | $\mathbf{- 6 . 8}$ | $\mathbf{- 1 2 . 3}$ | $+\mathbf{4 . 6}$ | $+\mathbf{8 . 0}$ | +3.6 |

The manufacturing sector, the largest in the Mauritian economy accounted for 20.0 \% of GDP in 2008. It registered a positive growth of 3.2 \% in 2008 compared to 2.2 \% in 2007. The performances of its sub-sectors were as follows:

- The Sugar milling sector registered a positive growth of 3.7 \% in 2008 after a negative growth of $13.6 \%$ in 2007. This is explained by a sugar production of 452,062 tonnes in 2008 compared to 435,972 tonnes in 2007.
- The Food Sector (excluding sugar) registered a positive growth of $7.5 \%$ in 2008 against a 4.0 \% increase in 2007.
- The Textiles sector shows no growth in 2008. Increases of $8.5 \%$ and 2.9 \% were registered in 2007 and 2006 against negative growths of $14.7 \%$ and $7.2 \%$ in 2005 and 2004.
- The EOE sector registered a growth of 3.6 \% in 2008. EOE exports which accounts for nearly $89 \%$ of the EOE sales was estimated at Rs 35,080 million in 2008 compared to Rs. 37,840 million in 2007.

## COVERAGE,

## CONCEPTS

AND

## DEFINITIONS

## COVERAGE, CONCEPTS AND DEFINITIONS

## 1. Coverage

The Industrial Sector, according to the International Recommendations for Industrial Statistics, comprises the following NSIC activity groups:

|  | NSIC Code |  |
| :--- | :--- | :---: |
| 1. | Mining and Quarrying | $\mathbf{1 4}$ |
| 2. | Manufacturing | $\mathbf{1 5 - 3 7}$ |
| 3. | Electricity, Gas \& Water Supply | $\mathbf{4 0}$ |

1.1 Mining and quarrying covers salt production and stone and sand quarrying.
1.2 The Manufacturing Industries cover the production of a wide range of goods and have been classified under the following broad groups:

- Sugar milling
- EOE
- Non-EOE
1.3 Electricity, Gas and Water Supply covers the activities of the following:
- The Central Electricity Board (C.E.B.)
- The Central Water Authority (C.W.A.)
- "Firm" Independent Power Producers

## 2. Concepts and Definitions

All tables have been compiled on an establishment basis.

### 2.1 Establishment

An establishment is defined as an economic unit, which engages in one or predominantly one kind of activity at a single location and under a single ownership.

Large establishments refer to all establishments, which engage ten or more persons. The source of data referring to employment in large establishments is the Annual Survey of Employment and Earnings carried out by this office.

### 2.2 Employee

An employee is defined as any person who is in regular or casual employment. It includes any person who is temporarily absent on paid sick or vacation leave as well as persons holding managerial posts, family workers receiving wages and salaries and paid apprentices.

## Definitions of national accounts aggregates

The concepts and definitions used in this publication follow the recommendations of the 1993 System of National Accounts (SNA93) which was implemented in April 2001.

### 2.3 Gross output

Gross output of industries covers the market value of goods and services produced, including work-in-progress and products for own use. Gross output is valued at basic prices. The basic price is the amount receivable by the producer, exclusive of tax on products but including any subsidy on these products.
Taxes on products are payable on goods and services when they are produced, sold or used. Examples are excise duties, import duties and Value Added Tax (VAT).

### 2.4 Intermediate consumption

Intermediate consumption of industries covers non-durable goods and services used up in production, including repairs and maintenance of the capital stock and are valued at purchasers' prices. The purchasers' price is the amount payable by the purchaser exclusive of deductible taxes on products e.g. deductible value added tax.

### 2.5 Value added (Net output)

The value added is equal to gross output at basic prices less the value of intermediate consumption at purchaser's prices.

### 2.6 Gross Domestic Product (GDP)

Gross Domestic Product is the sum of value added of all domestic producers. It represents the aggregate money value of all goods and services produced within a country out of economic activity during a specified period, usually a year, before provision for the consumption of fixed capital.

GDP at basic prices is obtained as the difference between output and intermediate consumption whereby output is valued at basic prices and intermediate consumption at purchasers' prices.

### 2.7 Compensation of employees

Compensation of employees comprises all payments of wages and salaries by producers to their employees. Payments in kind as well as in cash and contributions to social security and to private pension, casualty insurance and similar schemes are also included.

Wages and salaries in cash include all payments which employees receive in respect of their work before deductions of employees' contributions to social security schemes.

They include commissions, overtime payments, bonuses, cost of living allowance, housing allowances, etc.

Wages and salaries in kind are goods and services provided to employees free of charge or at a markedly reduced cost, which are clearly of direct benefit to the employees as consumers.

### 2.8 Gross Operating surplus

Gross operating surplus is defined as the excess of value added at basic prices over the cost of employees' compensation and other taxes on production and imports net of subsidies.

### 2.9 Other taxes on production

These consist of all taxes except taxes on products that enterprises incur as a result of engaging in production. Such taxes do not include any taxes on the profits or other income received by the enterprise and are payable irrespective of the profitability of the production. They may be payable on the land, fixed assets or labour employed in the production process or on certain activities or transactions.

## SOURCES AND METHODS

## 1. Mining and quarrying

The activity of mining and quarrying covers salt production, stone and sand quarries. The share of this industry in the Gross Domestic Product is negligible. Estimates of gross output and value added are based on information collected through special enquiries.

## 2. Manufacturing

The manufacturing sector is the largest sector in the Mauritian economy. It contributes to around $20 \%$ of Gross Domestic Product and provides jobs for nearly $30 \%$ of the total employed.

## Sources

1. Receipts and Expenditure Survey - Manufacturing.
2. Annual Survey of Employment and Earnings
3. Quarterly Index of Industrial Production (QIIP)
4. Foreign Trade Statistics
5. Household Expenditure Survey 2001/02
6. Census of Economic Activities
7. Mauritius Chamber of Agriculture
8. Mauritius Sugar Syndicate
9. VAT data

## Methodology

The manufacturing sector is more conveniently analysed under the following broad groups:
(i) Sugar Milling
(ii) Food (excluding sugar)
(iii) Textiles
(iv) Other

Sugar: Production account in respect of sugar milling is prepared from annual reports of the Chamber of Agriculture and from financial statements of the Mauritius Sugar

Syndicate. For sugar milling, the end product is sugar and only millers are engaged in its production. The gross output is worked out from the gross proceeds of sugar. The main inputs are sugarcane, milling cost and marketing expenses.

Establishments in the manufacturing sector (excluding sugar milling) are surveyed once a year through the Receipts and Expenditure Survey. An estimate of value added for the current year is calculated using the working ratio "value added/gross output" worked out on the previous years' figures. Value added in respect of non-respondents is estimated using indicators available, e.g., employment, imports of raw materials and exports of finished goods. These estimates are checked with estimates from VAT data. Production accounts are worked out for each of the NSIC groups.

Technical ratios such as gross output / employee, value added / gross output and labour costs / value added are also calculated. These are used to make estimates for the nonrespondents and also help in forecasting exercises.

## 3. Electricity, gas and water Supply

This sector covers the activities of the following:

- $\quad$ The Central Electricity Board (C.E.B.)
- $\quad$ The Central Water Authority (C.W.A.)
- "Firm" Independent Power Producers

The generation of electricity is undertaken by C.E.B. and the independent power producers, while its distribution is effected by C.E.B. only. The C.W.A. is responsible for the storage and supply of water.

Questionnaires are sent twice yearly to the relevant bodies to collect information for the preparation of the production accounts. One questionnaire relates to production and asks for detailed information on receipts, employment and labour costs, purchase of goods and services (local and imported) and stocks of materials while another relates to investment on fixed assets. Data on acquisition of assets such as buildings, plant, machinery and transport equipment are used in the computation of estimates of gross domestic fixed capital formation by type of goods.

## 4. Estimates at Constant Prices

### 4.1 General

The production account of the Industrial Sector is initially prepared at current prices. For many analytical purposes, estimates are required which are free from the effects of changes in prices. Working at constant prices allows the study of volume or real growth of a particular sector of the economy.

A 'normal' year is usually selected to represent the base year and the 'quantity' produced in the subsequent years are either revalued at the base year price or the value of goods produced during the current year are deflated by an appropriate price index (deflator).

### 4.2 Double-deflation method

The value added or the net output of an industry is a residual obtained after subtracting its intermediate consumption from its gross output. Therefore, to obtain the value added at constant prices, both the gross output and the input of goods and services should be revalued at constant prices. This method, the ideal one, is known as the "doubledeflation" method. However, this method requires extensive data on both inputs and outputs, which, in practice are very difficult to obtain. Therefore, other methods using 'proxy indicators' are used to indicate volume changes. The proxy indicators most often used are: -
(a) Physical quantities of goods produced
(b) Physical quantities of materials used
(c) Employment

As most industries produce a large number of heterogeneous products it is not possible to obtain separate physical output or input series. The value series are most often deflated by an appropriate price index to obtain a constant price estimate.

The indices normally used are: -
(i) Producer Price Index (PPI - Manufacturing)
(ii) Quarterly Index of Industrial Production (QIIP)
(iii) Consumer Price Index (CPI)
(iv) Construction Price Index
(v) Wage/Salary Index
(vi) Import and Export Price Index

The method used to work out estimates of value added at constant prices for the various industry groups of the industrial sector are given below.

## QUARTERLY INDEX

## OF

INDUSTRIAL PRODUCTION

# QUARTERLY INDEX OF INDUSTRIAL PRODUCTION (QIIP) 

## Explanatory Notes

## Introduction

The Quarterly Index of Industrial Production (QIIP) is an industrial short-term indicator which aims at measuring, on a quarterly basis, the ups and downs of the volume of industrial output with a special focus on detecting, as early as possible, the turning points of the business cycle. The indices are given separately for "Mining and quarrying", "Manufacturing" and "Electricity, gas and water". Within "Manufacturing", indices for the broad groups, namely EPZ, Non-EPZ and Sugar milling are also given. It is to be noted that for the Non-EPZ, because of the non-availability of basic data on small establishments, the index can be considered to refer to large establishments only.

## Weights

The weights have been derived (separately for EPZ and Non-EPZ within the Manufacturing Sector) from value added at basic prices by detailed industry group compiled from the 2002 Census of Economic Activities. The index is calculated for each of the lowest level of activity classification and aggregation to the broader level is done as a weighted arithmetic average of the lowest level indices.

## Reference Year

The reference period for the calculation of the indices is 2002.

## Index Calculation

The index is calculated according to a modified Laspeyre's index and the formula is:

$$
\begin{aligned}
& \mathrm{I}_{\mathrm{t}}=\frac{\sum \mathrm{W}_{\mathrm{i}}\left(\mathrm{Q}_{\mathrm{it}} / \mathrm{Q}_{\mathrm{io}}\right)}{\sum \mathrm{W}_{\mathrm{i}}} \quad \mathrm{X} 100 \\
& \text { with } \quad \mathrm{I}_{\mathrm{t}} \quad=\text { index for quarter } \mathrm{t} \\
& \mathrm{Wi}=\text { weight for activity } \mathrm{i} \\
& \text { (Qit/Qio) }=\text { is the growth in real value added of activity } i \text { in quarter } t \\
& \text { relative to the base year as estimated by an appropriate proxy } \\
& \text { indicator }
\end{aligned}
$$

Table 22:- Index of industrial production by section - annual and quarterly indices, 2005-2008

## LABOUR PRODUCTIVITY

## AND

UNIT LABOUR COST

# PRODUCTIVITY AND UNIT LABOUR COST INDICES 

## Explanatory Notes

## Introduction

This section relates to a new set of productivity and competitiveness indices. For each of the indices, separate series have been worked out for the Manufacturing Sector as follows:
(a) Manufacturing including sugar
(b) EOE Sector only

The indices cover all production units irrespective of size. It is recalled that in the previous issues of the digest, the indices published covered large enterprises only, that is those employing ten or more workers.

## Labour productivity index

Labour productivity is conventionally measured as the ratio of real output to labour input. Although this measure relates output to the number of employees, it does not measure the specific contribution of labour as a single factor of production. Rather, it reflects the joint effects of many influences, including new technology, capital investment, capacity utilisation, energy use, and managerial skills, as well as the efforts of the workforce.

Labour productivity index shows the rate of change in output per person engaged.

$$
\text { Labour Productivity Index }=\frac{\text { Production index }}{\text { Employment index }} \times 100
$$

## Capital productivity index

Capital productivity is the index of the ratio of real output to stock of fixed capital used in the production process. This index should be interpreted with care since partial measures can be very misleading if taken alone, as they include amongst other factors, the effects of the substitution of one resource for another, such as capital for labour.

The capital productivity index shows the rate of change in output per unit of capital.

$$
\text { Capital Productivity Index }=\frac{\text { Production index }}{\text { Capital stock index }} \times 100
$$

## Multifactor productivity index (MFP index)

The limitation of partial productivity measures such as labour and capital productivity indices is that they attribute to one factor of production, changes in efficiency that are attributable to
other factors including qualitative factors such as better management, improved quality of inputs through training and technology as well as higher quality products and economies of scale. A measure of growth in efficiency which takes account of changes in the most important factors; labour and capital is given by the MFP growth. MFP is calculated as the ratio of output to a weighted combination of labour and capital inputs.

$$
\text { MFP index }[A(t)]=\frac{\text { Production index }}{\text { Multifactor input index }} \times 100
$$

$$
\mathrm{A}(\mathrm{t})=\frac{\mathrm{Q}(\mathrm{t})}{\{\mathrm{WL}(\mathrm{t}) \times \mathrm{L}(\mathrm{t})\}+\{\mathrm{WK}(\mathrm{t}) \times \mathrm{K}(\mathrm{t})\}} \mathrm{x} 100
$$

$\mathrm{WL}(\mathrm{t})=$ Labour's input share in time t (ratio of compensation of employees to value added)
$\mathrm{L}(\mathrm{t})=$ Labour input index in time t
$\mathrm{WK}(\mathrm{t})=$ Capital share in time t (ratio of gross operating surplus to value added)
$K(t)=$ Capital input index in time $t$

$$
W L(t)+W K(t)=1
$$

## Unit labour cost index (ULC)

Unit labour cost is the remuneration of labour to produce one unit of output. It is computed as the ratio of the labour cost index to an index of production. The index shows the rate of change in labour cost per unit of output.

$$
\text { Unit labour cost index }=\underset{\text { Production index }}{\text { Labour cost index }} \times 100
$$

or

$$
=\underline{\text { Average compensation index }} \times 100
$$

Table 26:- Productivity, Labour cost and Unit labour cost indices, Manufacturing Sector including Sugar, 1988-2008

FIG XVII : SECTORAL ELECTRICITY CONSUMPTION ( 2007-2008)
(2007

## PRODUCER PRICE INDEX

## (Manufacturing Sector)

# PRODUCER PRICE INDEX - MANUFACTURING (PPI-M) 

## Explanatory Notes

## 1. Introduction

The Producer Price Index - Manufacturing (PPI-M) measures the average change in the selling prices received by manufacturers for the part of their output that is sold on the domestic market. It reflects the price trends of a constant basket of goods, which represents the output of the selected industries. The CSO first published a Producer Price Index for the Manufacturing sector in March 1994, with 1993 as reference period, but the coverage was then limited to the "Manufacture of food, beverages and tobacco". The scope of the index has been extended to cover all relevant industry group of the Non-EOE manufacturing sector.

## 2. Weighting Scheme

The weights have been calculated from the gross output figures derived from the 2002 Census of Economic Activities. Gross output is valued at basic prices, and thus excludes all taxes on products, namely excise duties and value added tax. The weight of a product group represents the share of its gross output out of the total output of the manufacturing sector. In the case of sugar, only the sale on the local market has been taken into consideration in establishing the weights.

## 3. Reference Year

The reference year for the calculation of price relatives is 2003. The base price for a particular product is the arithmetic mean of the 12 monthly prices in 2003.

## 4. Index Calculation

The PPI-M is calculated at the 5-digits level of NSIC. Indices at the Division level (2-digits NSIC) are then derived as a weighted average of the indices of the products falling within each division. Finally, the overall index for manufacturing is obtained as weighted average of the Division indices. The PPI is calculated according to a modified Laspeyre's formula, which is the weighted average of price relatives.

The index is base weighted and the formula is:

$$
I_{c}=\frac{\sum W_{i} *\left(\frac{P_{c i}}{P_{o i}}\right)}{\sum W_{i}} * 100
$$

where $I_{C}=$ Index for current month
$\mathrm{W}_{\mathrm{i}}=$ Weight associated with product i
$\mathrm{P}_{\mathrm{ci}}=$ Price of product i for the current month
$\mathrm{P}_{\mathrm{oi}}=$ Price for product i for the reference period (2003)
