

CONSUMER PRICE INDEX

(Base period: July 2006–June 2007 = 100)

3rd Quarter 2010

1. INTRODUCTION

This issue of Economic and Social Indicators presents the Consumer Price Index (CPI) for the third quarter of 2010. The methodology used for computing the CPI and the inflation rate is given in the technical note at Annex.

2. KEY POINTS

2.1 The overall CPI

The Consumer Price Index, which stood at 119.9 in June 2010, registered a net increase of 0.8 point (or 0.7%) to reach 120.7 in September 2010 (Table 2a).

On a monthly basis, the index increased by 0.3 point in July, 0.4 point in August and 0.1 point in September 2010.

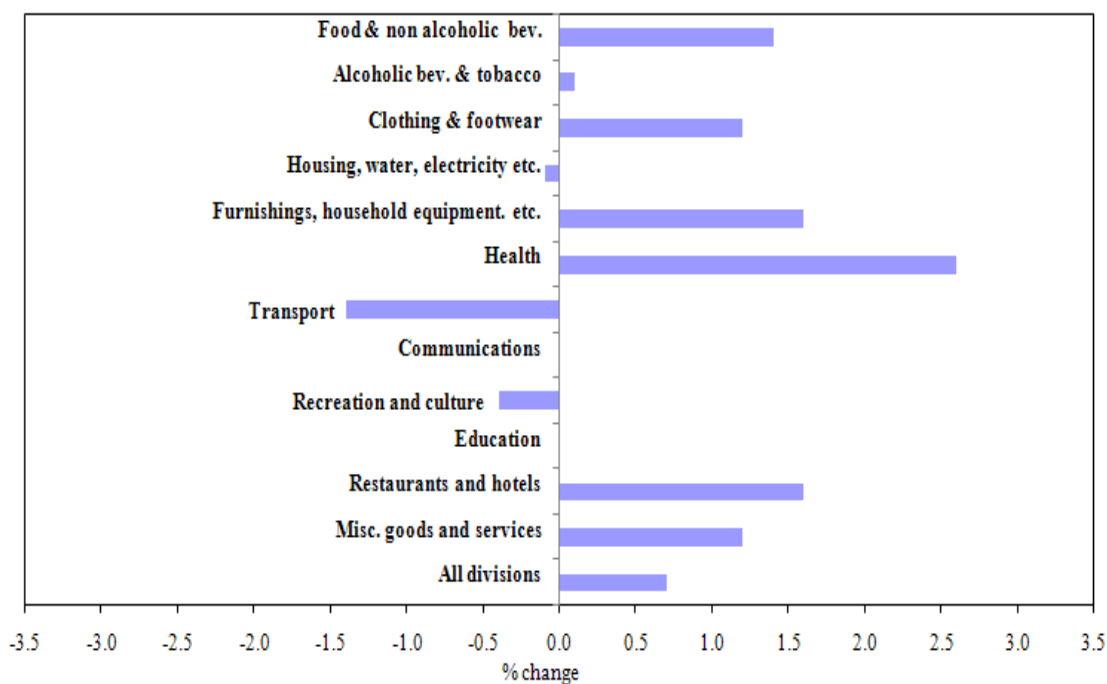

2.2 Overview of CPI movements

The main reasons for the net increase in the CPI from June to September 2010 were:

- (a) higher food prices mainly vegetables, meat, and milk;
- (b) higher prices of motor vehicles;
partly offset by
- (c) lower prices of gasoline and diesel.

3. MOVEMENT OF CPI SUB INDICES

Figure 1: % change in CPI sub indices between June and September 2010

The changes in the sub-indices for the twelve divisions of consumption expenditure during the third quarter of 2010 were as follows:

<i>Food and non-alcoholic beverages (+1.4%)</i>	The rise of 1.4% was the result of higher prices of vegetables (+3.9%), meat (+3.2%), milk (+2.1%), cooking oil (+2.0%) and a variety of other food products (+6.0%). The effect of these increases was partly offset by lower prices of fruits (-7.6%) and rice (-1.3%).
<i>Alcoholic beverages and tobacco (+0.1%)</i>	The increase of 0.1% was mainly due to higher prices of some beer (+0.3%).
<i>Clothing and footwear (+ 1.2%)</i>	The rise of 1.2% was mainly due to higher prices of ready-made clothing (+1.6%).
<i>Housing, water, electricity, gas and other fuels (-0.1%)</i>	The fall of 0.1% was essentially due to lower interest rates on housing loans (-3.3%) partly offset by higher workman's wages (+10.3%).
<i>Furnishings, household equipment and routine household maintenance (+1.6%)</i>	The rise of 1.6% was largely due to higher prices of washing materials and softeners (+2.9%).
<i>Health (+ 2.6%)</i>	The increase of 2.6% was mainly attributable to higher clinic fees (+6.1%) and higher prices of medicinal products (+1.9%).
<i>Transport (- 1.4%)</i>	The fall of 1.4% in transport costs was mainly due to lower prices of gasoline (-8.0%) and diesel (-10.6%) partly offset by higher prices of motor vehicles (+4.9%).
<i>Communication</i>	Unchanged
<i>Recreation and culture (- 0.4%)</i>	The fall of 0.4% was largely attributable to lower prices of audio and video equipment (-4.8%).
<i>Education</i>	Unchanged
<i>Restaurants and hotels (+1.6%)</i>	The rise of 1.6% was mainly the result of higher prices of food and drinks in restaurants (+2.2%).
<i>Miscellaneous goods and services (+1.2%)</i>	The increase of 1.2% was mainly attributable to price increases of some goods for personal care and hygiene (+1.1%), and for personal effects (+10.6%).

4. INFLATION RATE

The inflation rate for financial year 2009/10 was 1.7% and that for calendar year 2009 was 2.5% (Table 6).

On the basis of trends in previous years and recent price changes, the inflation rate for calendar year 2010 is estimated at around 2.8%.

5. INTERNATIONAL COMPARISON OF INFLATION RATE

The table below compares the inflation rate of Mauritius with those of our main importing countries and some countries in the region for the latest available year, namely 2009.

Table 1- Inflation rate (%) of selected countries, year 2009

Country	Inflation rate (%)	Country	Inflation rate (%)
France	0.1	Australia	1.8
United Kingdom	2.1	United States	-0.3
China	-0.7	Botswana	8.1
India	10.9	Mauritius	2.5
Japan	-1.4	Seychelles	31.8
Singapore	0.6	South Africa	7.1

Technical note

1. Methodology used for the computation of the Consumer Price Index (Base July 2006 – June 2007 = 100)

(a) Definition

The **Consumer Price Index** (CPI) is an indicator of changes over time in the general level of prices of goods and services acquired by Mauritian consumers.

(b) Measurement of the CPI

The CPI measures price change by comparing, through time, the cost of a fixed basket of goods and services. As prices vary over time, the total cost of the basket also changes and thus the CPI measures the change in the cost of this basket. It provides a way to compare what this basket costs at a given period relative to a reference or base period.

The cost of the CPI basket is assigned a value of 100 in the base period and the costs in other periods are expressed as percentage changes compared to the base period. For example, if the CPI is 110, this means that there has been an increase of 10% in the cost of the basket since the base year; similarly an index of 90 means a 10% decrease in the cost of the basket.

(c) The CPI basket

The CPI basket is based on the expenditures of private Mauritian households in a reference period, currently July 2006 to June 2007. The composition of the current CPI basket has been derived from the 2006/07 Household Budget Survey (HBS) data. It has been determined in accordance with latest ILO and SADC recommendations.

The items constituting the basket have been selected on the basis of the importance of household consumption expenditure on them. The basket includes all important items on which consumption expenditure is significant, i.e. accounting for around 0.1% or more of total household consumption expenditure. Each item's relative importance, which is called the "weight" (usually expressed on a total of 1000), is the expenditure share of the item. Non-consumption items such as income tax, social security contributions, purchase of land, shares and life insurance are excluded.

The commodities in the basket are classified according to the UN COICOP (Classification of Consumption Expenditure according to Purpose) with 12 divisions, 43 groups and 84 classes.

(d) Price coverage

The prices used in the CPI calculation are those that any member of the public would have to pay to purchase the specified goods or services. Any taxes on products attached to the goods are included.

Price collection is done on a regular basis. Each month, around 7,800 price quotations are collected in respect of 1,080 item indicators from some 400 outlets selected to be representative of regions across the islands of Mauritius and Rodrigues.

Prices of non-perishable items are collected monthly in the nine geographical districts of the island of Mauritius and in Rodrigues.

Prices of fresh fruits, vegetables, meat and fish are collected on a weekly basis from 9 markets in Port Louis, Rose Hill, Quatre Bornes, Vacoas, Mahebourg, Flacq, Goodlands, Pamplemousses and Port Mathurin.

Information on rent is obtained from a quarterly rent survey of some 100 rented dwellings.

(e) Formula for computation of the CPI

The CPI is computed according to the Laspeyres Formula as a weighted average of price relatives of individual items. The weights are fixed and correspond to the base period expenditures. The Laspeyres Index measures the cost of a basket of goods and services at different points in time, relative to the cost of the same basket in the base period.

The formula used for computing the CPI at time t is

$$I_t = \frac{\sum W_i (P_{it} / P_{i0})}{\sum W_i} \times 100$$

where,

- I_t : CPI for period t with reference to a base period 0
 P_{i0} : Price of item i at time 0, i.e. during base period
 P_{it} : Price of item i at time t
 W_i : Weight of item i

The base period is July 2006 to June 2007, the period during which the latest HBS was conducted.

2. Inflation

(a) Definition of Inflation

Inflation is the percentage change in the level of prices (as measured by the CPI) from one period to another.

(b) Calculating the Inflation Rate

The headline inflation rate in Mauritius, like in many other countries, is calculated by using the annual average method, i.e. by comparing the average level of prices during a twelve-month period with the average level during the corresponding previous twelve-month period. This type of inflation rate is more appropriate for adjusting wages, salaries and pensions to compensate for loss of purchasing power. *All inflation rates presented in this publication relate to the headline inflation.*

Another commonly used method of calculating the inflation rate is the so called ‘year-on-year’ method. The year-on-year inflation rate is calculated as the percentage change in the CPI for a given month with respect to the CPI for the corresponding month of the previous year. It is generally used by central banks for monetary policy decisions. Year-on-year inflation rates are not presented in this publication but can be easily calculated through the available monthly CPI.

Note: More information about the concept, computation and use of the CPI is available online in the publication “HBS 2006/07 and updated CPI” [<http://www.gov.mu/portal/goc/cso/ei664/toc.htm>]
