# Quarterly Index of Industrial Production (QIIP) Fourth Quarter 2012 

## 1. Introduction

The Index of Industrial Production shows the evolution of the volume of output of the Industrial Sector which covers "Mining and quarrying", "Manufacturing", "Electricity, gas, steam and air conditioning supply" and "Water supply; sewerage, waste management and remediation activities" and accounts for around $20 \%$ of Gross Domestic Product (GDP). The index compiled on a quarterly basis is one of the most important industrial short-term indicators, which aims at measuring, on a quarterly basis, the changes in the volume of industrial output.

## 2. Contents of the publication

This issue of "Economic and Social Indicators" presents the quarterly indices for the first quarter of 2008 to fourth quarter of 2012 with weights based on the results of the 2007 Census of Economic Activities.

The indices are given separately for the four sections, namely, "Mining and quarrying", "Manufacturing", "Electricity, gas, steam and air conditioning supply" and "Water supply; sewerage, waste management and remediation activities". Within "Manufacturing", estimates by broad group, namely Export Oriented Enterprises (EOE), Non-EOE and "Sugar milling" as well as by main industrial grouping are given. Wherever possible, the annual averages of the quarterly indices have been worked out and included in the tables. It is to be noted that, due to incomplete data, indices for the fourth quarter of 2012 are provisional and published at section and broad group level only. They are therefore subject to revision in future issues of the Economic and Social Indicators of QIIP.

The published indices are not seasonally adjusted. The user is therefore advised to base comparisons for a particular quarter of a year on the corresponding quarter of the previous year.

The objectives of the QIIP, data sources and methodology used in the compilation of the index as well as the limitations of the index are given at annex.

## 3. The overall index - Industrial Sector

In the fourth quarter of 2012 the overall index of industrial production increased by $10.8 \%$ compared to the previous quarter, and grew by $3.8 \%$ compared to the corresponding quarter of 2011.

The index for the year 2012 worked out as the average of the quarterly indices went up by $1.3 \%$ compared to 2011 . This is explained mainly by increases in the real output of "Manufacturing" ( $+1.5 \%$ ), "Electricity, gas, steam and air conditioning supply" $(+4.5 \%)$ and "Water supply; sewerage, waste management and remediation activities" ( $+1.6 \%$ ) partly offset by a contraction in "Mining and quarrying" (-8.3\%).

Within "Manufacturing", "Export Oriented Enterprises (EOE)" and "Non-EOE" sector grew by $1.5 \%$ and $2.1 \%$ respectively while the "Sugar milling" went down by $6.3 \%$.

## 4. Changes by section

### 4.1 Mining and quarrying

"Mining and quarrying" comprises activities relating to quarrying of decorative stones, sand and salt extraction as well as stone crushing and represents only $2 \%$ of the output of the industrial sector. In the fourth quarter of 2012, real output increased by $7.9 \%$ compared to the previous quarter and by $16.6 \%$ compared to the corresponding quarter of 2011. In 2012 real output went down by $8.3 \%$ (Table 1).

### 4.2 Manufacturing

Manufacturing output, which covers the production of a wide range of goods, represented $88 \%$ of the output of the industrial sector in 2011. For analysis purposes, "Manufacturing" is broken down into the following broad groups:

- Sugar milling representing around $2 \%$ of manufacturing output
- EOE (39\%)
- Non-EOE (59\%)

Manufacturing output in the fourth quarter of 2012 grew by $9.2 \%$ compared to the previous quarter and by $2.9 \%$ compared to the corresponding quarter of 2011 (Table 1). In 2012, real output expanded by $1.5 \%$. This is explained by increases of $1.5 \%$ and $2.1 \%$ in "EOE" and "Non EOE" respectively, partly offset by a contraction of $6.3 \%$ in the output of "Sugar Milling". The performances of the EOE and the Non-EOE excluding "Sugar Milling" by detailed industry
 group up to third quarter 2012 are analysed separately in Section 6.

### 4.3 Electricity, gas, steam and air conditioning supply

"Electricity, gas, steam and air conditioning supply" accounts for around $8 \%$ of the output of the industrial sector. In the fourth quarter of 2012, real output of this sector went up by $22.5 \%$ compared to the previous quarter and by $8.7 \%$ when compared to the corresponding quarter of 2011. In 2012, it is estimated to have moved up by $4.5 \%$ (Table 1).

### 4.4 Water supply; sewerage, waste management and remediation activities

"Water supply; sewerage, waste management and remediation activities" accounts for around $2 \%$ of the output of the industrial sector. In the fourth quarter of 2012 , real output of this sector went up by $3.5 \%$ compared to the previous quarter and by $3.3 \%$ when compared to the corresponding quarter of 2011. In 2012, an expansion of $1.6 \%$ has been noted (Table 1).

## 5. Changes by broad group

### 5.1 EOE

Real output of the EOE contracted by $7.2 \%$ in the fourth quarter of 2012 compared to the third quarter of 2012 and grew by $3.5 \%$ when compared to the corresponding quarter of 2011. In the year 2012, output in the EOE went up by $1.5 \%$ (Table1).

Indices by main industrial grouping for the fourth quarter of 2012 are not yet available. However, an indication of the annual performance at this level can be obtained by comparing the detailed quarterly indices available for year ending third quarter 2012 to those for year ending third quarter 2011 (Table 3). Real output of "Wearing apparel", the most important industrial grouping within the EOE, and that of "Textiles" decreased by $4.1 \%$ and $10.3 \%$ respectively. These two sub-groups account for $75 \%$ of the total weight allocated to the EOE. Positive growths have been observed for "Food products" ( $+5.9 \%$ ), "Computer, electronic and optical products $(+8.4 \%)$, "Jewellery" $(+7.1 \%)$, whereas the production of "Other manufacturing" has decreased by $6.2 \%$. This is mainly explained by decreases in the production of "Chemical and pharmaceutical products" and also in "Leather products". Details of changes at sub-group level are shown in Chart 8.

### 5.2 Non-EOE excluding "Sugar milling"

Provisional estimate of the real output of Non-EOE establishments shows an increase of $23.0 \%$ in the fourth quarter of 2012 compared to the previous quarter and of $2.8 \%$ compared to the corresponding quarter of 2011. In 2012, the index grew by $2.1 \%$ (Table 1).

An indication of the annual performance at sub-group level is obtained by comparing the detailed quarterly indices available for year ending third quarter 2012 to those for year ending third quarter 2011 (Table 4). Increases were registered in "Food products excluding sugar" $(+4.0 \%)$ "Beverages" (+2.2\%), "Chemicals and chemical products" $(+4.0 \%)$ and "Other manufacturing" (+6.3\%). However, decreases were noted in "Textiles" (-7.5\%), "Wearing Apparel" (-8.4\%), "Printing and reproduction of recorded media" $(-1.8 \%)$, "Plastic and non metallic product" ( $-6.7 \%$ ) "Basic metals and fabricated metal
 products" ( $-12.2 \%$ ) and "Furniture" $(-14.6 \%)$ as illustrated in chart 10.

# ANNEX <br> Quarterly Index of Industrial Production (QIIP) - Methodology 

## 1 Introduction

The Index of Industrial Production shows the movement of the volume of output of the Industrial Sector. This index was calculated annually and published in the Digest of Industrial Statistics. Following the needs expressed by various institutions, both public and private, Statistics Mauritius decided to compile and disseminate the index on a quarterly basis. The compilation and dissemination of the Quarterly Index of Industrial Production is also one of the requirements of the International Monetary Fund (IMF) Special Data Dissemination Standard (SDDS).

## 2 Objectives

The Quarterly Index of Industrial Production (QIIP) is one of the most important industrial short-term indicators which aim at measuring, on a quarterly basis, the ups and downs of the volume of industrial output with a special focus on detecting, as early as possible, the turning points of the business cycle. This enables planners, decision makers and the business community at large to be aware of any sign of change in the progress of the economy in order to take appropriate and timely policy measures.

At the office level, the index based on "hard" data, provides useful and reliable inputs for the improvement of the annual production estimates and forecasts as well as estimates of quarterly value added for the Industrial Sector.

## 3 Concept/Definition

The basic concept of the Index of Industrial Production is the measurement of the change in real value added at basic prices. Given that value added is defined as the difference between output and input, the compilation of the index, on a quarterly basis, is faced with practical difficulties in obtaining the data required on inputs and outputs within a reasonable period. In the absence of detailed data for most of the different industrial groups, an approximation of the index is based on change in deflated turnover, physical output or other indicators of change in real value added generated by industrial enterprises. The indicators used by main industrial grouping/sector are as follows:

| Sector/Industrial grouping | Indicators used |
| :--- | :--- |
| Mining and quarrying | Value added deflated by appropriate deflators |
| Industry groups within manufacturing  <br> (excluding sugar milling) Use of proxy indicators <br> i. <br>  Volume of production <br> ii. Employment <br> iii. Turnover data deflated by appropriate <br> deflators (for most of the industry  |  |
|  | iv.groups) <br> Consumption of raw materials |

| Sector/Industrial grouping | Indicators used |
| :--- | :--- |
| Sugar milling | Value added deflated using the double <br> deflation method. However, until final data <br> are obtained quarterly changes are based on <br> proportions of the deflated annual <br> estimate/forecast. The proportions are <br> computed from the latest quarterly cost <br> structure of milling activities (see sections 7 <br> and 8). |
| Electricity, gas, steam and air conditioning <br> supply | Volume of electricity sales as indicator. |
| Water supply; sewerage, waste management <br> and remediation activities | Volume of water sales as indicator. <br> VAT data |

The deflators used are the following price indices at detailed level, wherever possible:
i. Producer Price Index (PPI)
ii. Export Price Index (EPI)
iii. Consumer Price Index (CPI)
iv. Import Price Index (IPI)
v. Wage Rate Index (WRI)

## 4 Scope/Classification

The Quarterly Index of Industrial Production covers the Industrial Sector, which comprises:
Mining and quarrying (NSIC Section B),
Manufacturing (NSIC Section C),
Electricity, Gas, Steam and Air conditioning Supply (NSIC Section D), and
Water Supply; Sewerage, Waste Management and Remediation Activities (NSIC Section E)

The industrial classifications used is according to the National Standard Industrial Classification (NSIC), Revision 2 based on the UN International Standard Industrial Classification (ISIC) of all economic activities, Rev. 4 of 2008, previous classifications used being NSIC Rev 1 based on ISIC, Rev. 3 of 1990.

Moreover QIIP series prior to 2007 covered only large establishments for Non EOE subsector.
The main changes between the two classifications, NSIC1 and 2 are:
"Electricity, gas and water supply" which was previously classified under section E has been split into "Electricity, gas, steam and air conditioning supply" and "Water supply; sewerage, waste management and remediation" and classified under sections D and E respectively. Section E comprises also the activities of "Sewerage, waste management and remediation activities" which was formerly part of section O in NSIC 1.

Publishing activities have shifted from the "Manufacturing" sector to "Information and Communication".

## 5 Compilation practices

The weights have been derived (separately for EOE and Non-EOE within the manufacturing sector) from value added at basic prices by detailed industry group (mostly at 5-digit level of activity classification) compiled from the 2007 Census of Economic Activities. A representative sample has been selected from the CEA 2007 data which covers the whole manufacturing sector. The VAT turnover for the selected establishments is used to derive the index. The index is calculated for each of the lowest level of activity classification and aggregation to the broader level is done as a weighted arithmetic average of the lowest level indices. Under this methodology the weights are revised every year.

## 6 Data sources

As mentioned previously, use is extensively made of proxy indicators for the calculation of the index and one such indicator is deflated turnover data. Turnover data are mainly obtained from the VAT (Value Added Tax) Department, which is a very important source of secondary data. The sources of data by industry are as follows:

| Sector/Industrial grouping | Data sources |
| :---: | :---: |
| Mining and quarrying | - Survey of establishments <br> - Volume production of salt and sand <br> - Quarterly data from VAT <br> - Deflators used: change in producer prices |
| Industry groups within manufacturing (excluding sugar milling) | - Turnover data from VAT Department <br> - Trade statistics <br> - Quarterly Stock Survey <br> - Quarterly Survey of Employment among EOE <br> - Sales of excisable goods from the Mauritius Revenue Authority <br> - Continuous Multipurpose Household Survey <br> - Building permits statistics <br> - Deflators used: PPI M, EPI and IPI components |
| Sugar milling | - Survey of establishments <br> - Deflators used: PPI A and CPI components |
| Electricity, gas, steam and air conditioning supply | Returns from CEB and Independent Power <br> Producers (IPPs) <br> Volume of electricity sales |
| Water supply; sewerage, waste management and remediation activities | Returns from CWA and quarterly VAT data Volume of water sales |

## $7 \quad$ Problems/Constraints/Data quality

The practical difficulties in compiling an ideal index showing the evolution of value added at constant prices lead to the use of a number of approximation methods which are listed at section 3. Each of the methods has a number of constraints, the main ones being:

## Deflated turnover:

- quality of data from VAT Department. The data refer to a mix of formal "large" responding enterprises/establishments. The output of secondary activities of an enterprise are included in turnover data corresponding to the main activity of the enterprise;
- time-lag between production and sales may lead to a late identification of a turning point in the business cycle;
- ignorance of changes in stocks gives a false picture of true production. However, based on available information from the Quarterly Stock Survey, adjustments are made, wherever possible, to take account of changes in stocks;
- the quality of the index is subject to the precision and relevance of the different price indices used for deflation.
- assumption based on a fixed ratio of value added to gross output when, in fact, the ratio may change as a result of technological changes, productivity changes as well as seasonal variation in the production structure

## Consumption of raw materials:

- involves the assumption that output is constant per unit of materials used.

## Employment:

- does not take account of changes in labour productivity. Although, in the short term, it is reasonable to assume that labour productivity is relatively constant, this is not true in the long term;

## Volume of production:

- does not take account of quality changes

## Indirect Indicators

- Indirect indicators such as household consumption and building permits have been used to estimate volume changes for certain activities of small establishments. The volume changes may be revised when more appropriate data sources are obtained or after the next Census of Economic Activities is carried out.

## 8 Appropriateness of the QIIP

In spite of the above constraints/weaknesses, it is observed that the index shows relative consistency and is of reliable quality for the measurement of quarterly and other changes. However, great care should be taken when interpreting small changes that may be insignificant at the more detailed level.

## 9 Index calculation

The QIIP is calculated according to a modified Laspeyre's index and the formula is:

$$
\begin{aligned}
& \mathrm{I}_{\mathrm{t}}=\frac{\sum \mathrm{W}_{\mathrm{i}}\left(\mathrm{Q}_{\mathrm{it}} / \mathrm{Q}_{\mathrm{io}}\right)}{\sum \mathrm{W}_{\mathrm{i}}} \mathrm{X} 100 \\
& \text { with } \quad \begin{array}{l}
\mathrm{I}_{\mathrm{t}} \quad= \\
\mathrm{W}_{\mathrm{i}} \quad= \\
\quad \text { index for quarter } \mathrm{t} \\
\left(\mathrm{Q}_{\mathrm{it}} / \mathrm{Q}_{\mathrm{io}}\right)
\end{array}=\begin{array}{l}
\text { is the for activity } \mathrm{i} \\
\text { relative to the base year as estimated by an appropriate proxy } \\
\text { indicator }
\end{array}
\end{aligned}
$$
